I haven't used it too much, but I have EZ Score +. I use my Panasonic 1080 and it makes very nice printouts. They are improving the drivers (and upping the price) for 1.1 which should be available in may - they use GDOS fonts, but not GDOS itself, and support most common printers - it comes with many config files, but I suspect that any inexpensive but good Epson compatible will work well with it.

3610. Re: New Arc compressing method.

Squashed is Crunched, but using an extra bit (13 v.s. 12), and no repeat packing. I wrote an unarc for the ST supporting it (pkunarc might be it under a different name - pk are the PC version author's initals). There is VMS source available (I found elsewhere) that was _supposed_ to do unsquashing, and I simply hacked it until it worked for the ST. Actually, the compression used by ARC/PKARC comes right out of compress (also available on USENET), but hacked differently (repeat packing added for crunching, limiting to X bits, etc.).

3611. Re: how do I print-screen (Alt<help>) on Epson LQ-500/800?

Newsgroup: comp.sys.atari.st

A while ago, STart magazine had an accessory, which could use any Degas printer driver and replace the alt-help vector (which is what you need to do, change alt-help to point to your routine). I have some source based loosely on that accessory in MadMac/ALN (it uses ALN's include data file to import the Degas driver directly in) if that would help.

There is no way of doing so without a translator box, and that requires a Magic Sac, unless you also plan on adding a PC compatible drive to your Mac II (I don't think the disk controller on it can do one on the built in drive) - but if you do so, you can use PC format disks (720K PS/2 style) in the ST directly.

I have had my production version of DeskJet for about a week and have had absolutely no problems. I am using a parallel cable that I bought at a local computer shop for my old printer (years ago).

I usually turn the DeskJet printer on after the main computer, so I don't think that is the problem.

Sorry, but no other useful information.

"Mr. Lint" may explain this, but I'll mention it as well:

Statements such as the above are generally referred to as "sarcasm". I somehow suspect Karl knows better than to equate VAXes and UNIX. Unfortunately, there are zillions of people out there who *don't* know better.

> Come on, Mr. Lint! EVERYONE knows that UNIX is synonymous with SPARC!

Gee, I don't "know that UNIX is synonymous with SPARC"; my current machine happens to have a SPARC chip in it, but I work with 68K machines and occasionally 80386 machines and VAXes as well. (The nice thing about a portable OS such as UNIX is that 99% of the time it doesn't matter what chip the machine uses; the same OS runs there.)

It is conceivable that some Sun sales and marketing people may be trying to convey the *impression* that UNIX is synonymous with SPARC; such people should be tarred and feathered and dumped outside the city limits.

> (Ack! Phhpptttt! Panic: no TAS instruction! vmcore dumped)

No, SPARC has no instruction named TAS; the test-and-set instruction on SPARC is called LDSTUB (Atomic Load-Store Unsigned Byte).

Have you actually *read* the architecture manual carefully, or do you just think a detailed knowledge of something is unnecessary if you want to make reasonable comments about it?

I left your .sig in since it seems the best comment on your post (and
on those of others who have followed/will follow up in the same vein.)
To wit: "VAX" and "Berkeley VAX/UNIX" are the items being identified.
That's all the programmer's manual has ever promised. Yes, the
situation is uncomfortable at times for code-porters (I'm one of them.)
Yes, people who prefer 4bsdish systems to usgish systems (I'm guilty
again!) have the "not-phone-company-approved" canard to explain to their
management. Yes, Mr. Heuer joins a vast chorus of voices, all of which decry the situation
with great wailing and gnashing of teeth.
(And yes, the people who bring you 4.3 are -- reportedly: I haven't
seen the fruits of their work -- improving the situation.)

Now can we get on to something else?

it seems like there a a few of us frustrated developers (myself included in
spades) on the net who mostly like the ST but find a lot lacking in Tramiel,
Inc. (i'm trying to be as kind as possible :^). we started out giving what
we thought would be serious, constructive comments to our favorite company
and a few compasionate souls there (a. pratt, et al) were actually concerned
and tried to respond. the problem is THEY take pride in themselves (and
presumably) their company. the ringleaders have a more fiscal outlook and
recognize that we are an awfully small sample, hardly worth the effort.

in a fit of compasion we also though we were trying to educate our fellow
readers as to what goes on "behind the scenes" (as if they really did not
know). now we are getting sarcastic and hence bitter. i guess i'm just too
tired of the same old thing. let's ask ourselves: is it really worth the
extra gray hair or two? i mean, why the heck bother anymore? it does zero
good. the "average" reader of this newsgroup (based on postings) is either
not a developer and hence happy with the machine (because it's a good value)
or just doesn't care anymore.

and you know nothing you say has any impact AT ALL on how the T's run the
show. forget it, guys, it's not working. just count to 10, calm down, and
don't use the F or f key!

-bill

(i will remain forever silent about atari. i will also refrain from doing
much serious development work on any atari product, not that commodore/apple
are much better. better to tough it out in the ibm [serious] world. besides,
if all goes well, i should have a sun 386 to play with in a month or two :^)

From: jdg@elmgate.UUCP
Message-ID: <924@elmgate.UUCP>
Source record: 252669

I could'nt agree w/ Mr. Beckmeyer more! I can buy a PC-Clone much cheaper than a mega. And, the public domain applications software is in most cases better than commercial grade ST software. I do blame atari for claiming what nice support I was going to get on my $3000 purchase, and when it came right down to it, all that was tripe. During Deskcart!'s construction, several hardware/software questions were asked of atari and absolutely NO decent answers given. In fact, at one point QMI was told it cannot be done. Water under the bridge... QMI will be lucky to break even on the product. I rasied real comotion(sp?) on a local BBS by asking a simple question "Why should I develop software for the ST?". By the time it was done with, 3 people sold there ST's, and, still no decent answers. PRINT-IT!, another program I coded that never made it to market (another story completly) was given to Beta testers... And one day I recieve a phone call from a chap I had'nt talked w/ since early 8 bit days. We chatted botu' this and that... and, I was told (to my total astonishment!) that PRINT-IT! was on bulletin boards in california... He downloaded it and showed it to me! And I'm gonna make enough money to justify the time and effort put into an application? (har! har!). A mac II developers system was/is able to be had for $3500... Apple has an upgrade for AUX thats free... a total motherboard replacement... I would love to think that atari could reverse the trends that snowballed during their "we don't care syndrome". I like coding on the ST (did I say that?), beyond the masses of bugs, and the "I can only run this program if I dont have that program resident & that program I need because I want to do this... So, I'll go spend useless money on a program that works." (I wish atari had put the reset button on a function key, as, it gets as much action as any other key.) The root I guess is that the market has me (and I guess many others) totally perplexed.

(P.S. This is a borrowed acnt. send any email to the address below. It'll be forwarded to me).

cheers... Rick

> Sure! But keep in mind that the person who originally asked about this
> was not willing to spend more than $200! Also, the REAL Epsons have
> better quality print than any other printer. And most importantly (for
> music prints) it doesn't have those ugly blank lines in the graphix
> mode.

If this is so, why did Migraph do all of their original demo printouts on a Star SG-10? Because, in their humble opinions (as the producers of one of the best ST applications to date, EasyDraw), the SG-10 produced better output than the Espon FX-80. And cost less, too. Now you can buy the NX-10 from Midwest Micro for about $165. I think this printer would fit the original posters' bill pretty well. If you can afford it, the ND-15 (24-pin) is even better.

Epson printers are rather like IBM computers - they think they're the best, so they make their prices higher, even when many other companies offer more REAL performance at a significantly lower price. You do own an Atari ST, don't you Mr. Cisek?

The problem I was getting at with "virtual" MS-DOS emulators, even in a UNIX environment is how do you use the "virtual" MS-DOS devices? Can I delete your files (MS-DOS doesn't allow for protection) - can I read them? What about things like screen writes? There is a BIG difference between PC compatibility and MS-DOS compatibility, a and many PC programs are PC specific (or would be slower or have other problems). PC Ditto is useful mainly because it is 98% PC compatible - I can boot games directly. Can I stick Flight Simulator into the '386 UNIX box and have it run properly? My main point is that having a multitasking system with all it's protection is one thing - as soon as you try emulating a nonprotected, nonmultitasking environment you must trade off compatibility for other features. It can be done - just not that simply, and not without tradeoffs.

< % In article <4129@watcgl.waterloo.edu> mberkley@watnext.waterloo.edu (Mike Berkley) writes:
< % [some deleted text]
< % >One side effect of all this is that when I use the MWC cc, it thinks
< % >that I'm compiling from the desktop, so I have to press return after
< % >every cc command, a logical thing for it to do, but very annoying.
< %
< Try setting the environment variable 'camefrom=gulam'. This is a
< variable used by the cc program and msh to tell where it came from
< (obviously). If it doesn't find 'camefrom' in the environment, it
< assumes 'camefrom=desktop'. If 'gulam' doesn't work, try 'msh'.

How very strange. I have been running MWC with my own shell, from version 1 right up to the latest beta that I got of version 3, and I have neither had this problem, nor have I ever set (or was aware of) a "camefrom" variable. A scanning of the Lexicon entries for "msh" and "cc" yields no mention of this variable, or of any other thing that might cause "cc" to decide whether to wait for a return after it is finished.

I note that if even if I *do* set 'camefrom=desktop' (or CAMEFROM=DESKTOP, or CAMEFROM=desktop, or camefrom=DESKTOP'), "cc" *still* runs as it ought to from a shell, i.e. it does not wait for a return after it is done. Perhaps this "camefrom" thing is only one of the cues that it uses. There is also the special "_iovector" encoding (look up crts0 in the Lexicon). The _iovector value tells what devices the standard i/o streams are attached to. I wonder if Gulam sets this up properly?

Once again, we seem to be getting a rash of postings from people
who have given up on Atari, want to have nothing to do with Atari, and yet
have nothing to do but write tirades against Atari. As a satisfied Atari
customer, I feel compelled to respond.

Last time I checked, there was nothing which gave you all the Atari
did for a lower price. Dave, if this has changed, please feel free to post
your figures. I have found Atari software to fulfill every need I have.
Nothing extrodinary, just the basics: Terminal emulator (Uniterm),
Word Processer (Word Perfect (which has just put out another upgrade)),
Database (dbMaster One), spreadsheet (vc), Modula-2 compiler (TDI),
Drawing (EZ-Draw, again recently upgraded, IBM emulator for doing class
work which was to be graded on an IBM (PC-Ditto). A handful of other
miscellaneous utilities for printing and disk management. Not a lot,
but what I think the vast majority of users need. ST software exists for
just about every other common home and business user needs.

The only other computer I have worked with extensively is the Amiga.
in my experience, it crashed about as often as my ST: about once every two
weeks. The "buggy" OS has not hampered my use of my computer in any way.
Nor has it stopped the production of a number of fine programs for the ST.

The ST monochrome diplay screen is the best I know of for a home
computer, short of buying an expensive add-on monitor for your Mac.
Atari employees often give information and support here on the net.

I could continue, but I will summarize. The ST has never failed
to do the job I required of it. No other computer does the things I need
for as little money. I have heard no more complaints about it than any
other computer. I still would reccommend it to anyone who wants to buy a
computer.

I am wondering if it is possible to hook up your computer to a VCR or camcorder and superimpose graphics or text with a picture you are taking without videodigitizing the picture. I know there are character generaters out there, for camcorders, but is it possible to hook up the Atari as one of those?

This is something I've been waiting for it to come out, and now I see Electronic Arts has done it on the Amiga. I think the colloquial term is genlock. If anyone knows how long until it comes out on the Atari or how much it costs, please tell me, I am very interested.

P.S. I am also interested (there has been a little talk about it) if anyone has used a satelite dish to recieve weather radar pictures.

I feel that Atari should change the name on their 16-bit computers to fully lose their game image. I also feel the 'cartridge' port should be called an expansion port. There are many hardware products that would plug in through the expansion slot of an IBM PC, that plug in through the cartridge slot on an ST. I also feel that meeting deadlines, not making vaporware, and coming out with bug free software would help their reputation. A software program should have new versions come out to add features, not to fix problems. One last thing that would help is more expansion slots and expansion capabilities.

Atari needs to do more advertising. Atari relies all on "word-of-mouth" to advertise thier products. Although "word-of-mouth" is a major aspect of sales, you cannot expect to reach everyone by this method. I have seen numerous commercials for the Atari game systems, that use the approach that they need to use for their computers. They need to compare the ST to the Mac and the PC. The ST is much better than these computers, and I think this would get more busineses interested in Atari (which is Atari's goal, isn't it?). What they should do is have two comercials circulating during sports on TV. One commercial comparing the ST to the Mac, and one comparing it to the PC. They should also advertise in busines magazines, such as "Time" and "Newsweek". The ads in magazines should compare it to the Mac and PC, but also emphasize the laser printer/desktop publishing capabilities, and advertise other "aspects" of the ST (because you can say more for less in a magazine ad then on a TV ad).

I feel all of this should be done (especially the name change) before they introduce their next computer, which supposedly is the 030 box.

The ST is a good machine, everyone is always complaining, but I think it is about the best microcomputer on the market. I think it is an excellent computer for just about everything. But Atari must make people realize this.

(I'm not flaming anyone!)

From: Friesen@HIS-PHOENIX-MULTICS.ARPA
Message-ID: <880501033736.573118@HIS-PHOENIX-MULTICS.ARPA>
Source record: 252682

Does anyone know if there is a color laser printer available for the Atari ST, and if so, how much does it cost?

P.S. Speaking of printers...

I own a Quadram Quadjet printer, and am wondering if there are any printer drivers for it, for use with a wordprocessor such as First Word, or if I could get info. on how to make a printer driver. I also would like to know how I can get my printer to print screen dumps, and how I can get it to print Spectrum 512 color pictures.

Any help is greatly appreciated.

Source record: 252684

I just saw (actually about a month ago, but I havn't seen anyone post about it so here goes) the Supra FD-10 disk drive in "Byte". This drive allows you to save ten megabytes on a 5 1/4 floppy disk. It acts as a hard disk, and is said to take 80 milliseconds to access. It comes with software and cables. It plugs into the DMA port, and costs $895 for the Atari and Mac, and $1095 for the Amiga<--Ha Ha they have to pay more he,he. :-)

I called up my Atari dealer, and they said that they had talked to Supra a week ago. Supra was finishing the software, and the store expected to have it in about two weeks.

If you want more info, contact Supra yourself: Supra Corp. 1133 Commercial Way Albany OR 97321 Phone: (503) 967-9075

Source record: 252685

I have heard very different stories, I have heard that 4 Megs is a high as you can expand a 1040, I have heard that 4.5 Megs is as High as you can expand the 1040, and I have heard that 16 Megs is as high as you can expand the 1040.

I heard the 4 Meg limit was due to the OS.

I heard the 16 Meg limit was only possible if you cut open (to make room for the memory) the computer case, but that the limit was due to the microprocessor architecture.

I didn't hear why there was a 4.5 Meg limit.

Well, which is it?

(thanks in advance)

3636. Arcade games on the ST

Newsgroup: comp.sys.atari.st
Date: 1988-05-01 04:13:00 UTC
From: Friesen@HIS-PHOENIX-MULTICS.ARPA
Message-ID: <880501041352.036351@HIS-PHOENIX-MULTICS.ARPA>
Source record: 252686

Well I guess my machine is more of a business computer than most :-).
Everyone says that they have a lot of games for their Atari. Well I
only have 3 (plus about 4 PD ones and a few I have programmed). The
reason I don't have too many is because I like arcade action games, not
text adventure games (which seem to be the most common type). I would
like to see Atari (arcade games division) get together with Atari
(computer division) and program some of their arcade games for the ST.
I have played two fairly new games in the arcade by Atari, and they are
excellent. They are Roadblasters, and Blasteroids. These games are
very realistic in control response (at least they seem to be, I mean I
really dont know how it feels to control a spaceship shooting asteroids
:-)). Blasteroids is like a modern version (and much improved version)
of Asteroids. Roadblasters is like Pole Position, except you shoot your
apponents. These games have the most astounding resolution, sound, and
controls. I know it would be impossible to program these games for the
2600, because it is too limited, but the ST might just have enough power
for a very good reproduction. I hope Atari would change its mind about
not making games for the ST (after all, they
already made a few games for the ST, and Atari is the best arcade game
manufacturer). Oh well enough said, I just hope Atari is listening. I
really don't see why they won't make just a few games, I don't think
that would change the way anyone feels about the computer as far as
being for games only.

Aric Friesen

P.S.

Sometimes people ask, "If you knew when you bought your Atari, what you
know now, would you have bought it?

My answer is YES!YES!YES!YES!YES!YES! I love my Atari!!!!!!

>This is something I've been waiting for it to come out, and now I see
>Electronic Arts has done it on the Amiga. I think the colloquial term
>is genlock.

It's not Electronic Arts's doing; Amiga comes genlock-ready, and there
are several companies making genlock units for the Amiga, priced from
$150 (Mimetics "Amigen") to several thousand dollars. Electronic Arts
and other companies do manufacture programs that let you do animations
& titling suitable for superimposing on videos. Of course, the Amiga
also provides some other features that make it desirable for video,
such as full overscan output that prevents solid borders around images
when recorded on video tape.

This is not to say genlocking isn't possible on the Atari; I remember
seeing an article in an German computer magazine for a genlock unit for the
1040ST. I remember it costing a bundle (> 1000DM), and I do not
remember any details...

>P.P.S. Reply directly to me since I do not get USENET news.
>= =

We have found our bug, and will have it fixed in our next releases of
DC Formatter, version 3.0.

The problem (altho trivial now) took me some time to discover. We had our
handles correct, we simply initialized the intin array incorrectly (by one
element) and this caused stupendous crashes using GDOS.

I still can't see why anyone would bootup GDOS, unless they really needed it.
That program could use much improvement in the way it handles coordinate
conversions. No offense to Atari, but I bet it is written in 'C.'

Don't get me wrong, I love 'C' but for time critical code (and GDOS is since
it has to steal the trap #2 vector and do horrendous conversions) I would
surmise that pure hand massaged assembly would vastly improve it's speed.

If Atari would like, Double Click Software will do a PURE assembly conversion.
All we need is the source code. :-)

BTW - Maybe someone at Atari can tell me why when I boot up GDOS v1.1 with new ROMs (maybe with old ROMs too) I get a trap #1 (divide by zero error) so many times, before it does a good boot up? This seems to happen more on resets than on cold-starts.

- Mike

It is impossible. You need extra hardware.
Our solution to the same problem was a ST and a serial cable on top of the MAC.

> the disks.

You can't read Mac disks on the ST without hacking your disk drive and
controller some. The Mac disk controller, the IWM (stands for
Integrated Woz Machine), uses a peculiar format.

Most floppies, and all hard disks (that I know of) use _constant angular
velocity_. That means the disk always _spins_ at the same speed. The
Mac, on the other hand, uses _constant linear velocity_ (or very near
constant) which means they speed up and slow down the rotational speed
to keep the part of the disk passing under the head moving at the same
speed _relative to the head_.

To be able to read and write Mac disks on the ST, you need a disk
drive and controller pair that supports this speeding up and slowing
down of the rotational speed. Data Pacific sells one that goes with
the Magic Sac. Other than that, you are pretty much out.

There is a program for the Amiga which will read/write Mac disks, or
so I'm told. It will also read/write/format IBM PC and ST disks. Got
a friend with an Amiga? I might also be possible to write a Mac
program that can read/write ST disks - I don't know that much about
how programmable the IWM is.

Have you looked at TIFF (Tag Image File Format) yet? It is becoming
very popular in the MS-DOS world, and will be the file format of
choice in OS/2. Perhaps we should strive for this additional bit of
compatibility. The spec for it, I am told, is huge.

There is a good article about TIFF in the latest (May 88?) Dr. Dobb's
Journal. It is a pretty good explanation of what TIFF includes, and
includes addresses/phone numbers for getting more information,
including the TIFF library for MS-DOS and Mac (free!).

Ah, but ST disks ARE "Amiga-readable." I have some friends at the
school that have a program for the Amiga that allows it to
read/write/format ST, PC, and Mac disks. I know it works for ST and
PC disks - I've used it for that. I don't remember the name of the
program, but I will have them post it here.

Wrong! DEC has several operating systems for the VAX, and NONE of
them are named "UNIX." They have Ultrix, which is a DEC-bastardized
port of 4.2BSD, which is sort of Unix. (My System V bigotry showing
through again, I see.) They also have a real-time system called
VAXELN (I think), and then there is good ol' RSX-11, which runs as a
guest on VAXen with the PDP-11 compatibility mode.

To sum up, COULD WE PLEASE GET RID OF THIS USELESS DISCUSSION ON
COMP.SYS.ATARI.ST? Until VMS or one of the others runs on the ST, it
really doesn't belong here!

It would slow down ALL BIOS calls as a side-effect.

> My MWC manual lists a variable named "hdv_rw" under System Variables. This
> variable is said to point to the hard disk read/write routine. Does anybody
> know what parameters the hard disk read/write routine expects when called?
> Is this routine used by all calls to rwabs?

Yes, this vector is used by all (GEMDOS) reads/writes from/to the hard disk. The easiest way I know of to find out how the `rwabs' call works is to look at the source for Moshe Braners original ramdisk program for the ST. Is that still available on the net? I've got an extensively-hacked copy of it around here somewhere....

>is genlock. If anyone knows how long until it comes out on the Atari or
>how much it costs, please tell me, I am very interested.

Yes, this is called genlock. The idea is to take your ST's signal, synchronize it with your VCR/TV's signal, and blend the two together. Genlock is a fundamental part of the Amiga, and that's where all the "desktop video" hype comes from.

As for getting it NOW, I don't think there is such a beast avaliable. However, there are rumors that Antic (you know them guys, Spectrum 512, CAD 3D, all that terrific Atari stuff) is coming out with a genlock system for the ST.

This is not just wishful thinking: I've seen a promotional videotape from Antic for Atari's display at the West Germany Hannover faire, and one of the segments on the tape was "Genlock on the Atari ST". Whether or not Antic will market such a device (probably a hardware box), or whether someone else will, is another question.

--R.J.
B-)

P.S. I don't find my ST to be a "horrible" machine (Heck, it's the best one I've seen and afford!), but I do wish Atari management would get their act together (and maybe they have -- Anyone heard about Atari Computers, the newly-formed subsidiary?)

For $20 you can get an upgrade for Megamax, which has a source degugger.

I just recieved my manual, and have not yet had a chance to try it.

Geoffrey Giordano

Me?!?, Don't ask me. I'm just a brain dead poly student.

PS. Thanx to those who responded about the docs. I Megamax about them
they said they were sorry and would mail them right out. Two days later
they were in my mailbox. Thats what I call good customer service. Maby
ATARI should take lessons. :-)

3650. st keyboard buffering

Newsgroup: comp.sys.atari.st
Date: 1988-05-02 00:25:38 UTC
From: newman@dasys1.UUCP
Message-ID: <4215@dasys1.UUCP>

Sorry if this has whizzed by in this group before, but I would like to know if someone has a solution to the problem of buffering raw keyboard input on the ST, such as obtained by using the C routines Crawcin() or Bconin(). There doesn't seem to be any buffering at all with these routines, although I believe there is using the standard getchar (which is no good for my purposes). I would like perhaps a full 80-char line of typeahead and haven't been able to make sense of the keyboard queue routines in the Megamax docs. Thnx in advance.

Thank you Matthew. I have been quite happy with a 520ST (note NOT expanded to 1 Meg or with Modulator) that I bought back in January '86. I have several pieces of PD programs and a few other commercial programs that ALL work. Usually together or separately. I myself use Flash, as I love the editor in it. For WP, I use FirstWord Plus and as a database, SDB from David Betz, Thanks Dave. I have found a replacement, which I have sent to Steve Grimm, for VC.TTP called Sheet, now up to version 1.4.

So do I. I recommend it to many people. I was at a recent Music/Midi demo at a local Music store and the people doing the demos were from out of town and also recommended the ST for its' price and MIDI interfacing. They didn't sell the computers and sold software for many computer systems but seemed to recommend the ST for many things.

Hope others feel the same way.

Interesting but I wonder what XDOS does about vector tables in the data
segment since Intel and Motorola store longwords differently ie. reversed.
And then there is always the clowns who pervert the idea by putting data in
the code segment.

Never used gemdos call 0x4b (Exec) with a mode of 4?
You can have preloaded programs on the Atari ST as well, and it works quite nicely. I used it in a find command and in a shell I programmed for the Atari (yes, the Unix find command!), for example:
find .. -type d ! -name . ! -name .. -exec ls -l {} \;
(For those not familiar with find, this one finds all directories beneath the current directory's parent (excluding . and .. names) and does a ls -l on each one of them).

Each time loading ls worked fine on the ramdisk I used to use, but once I started working on a hard disk, it becomes really slooooooooooowwww!
Then I decided to preload the ls command (with gemdos(0x4b,3,"ls",0,0)). The gemdos function returns the basepage address of the loaded program. Now 'find', each time it has to 'ls', copies the argument string into the basepage; then it runs 'ls' by gemdos(0x4b,4,0,0,0) (I don't remember whether these are the correct values for the parameters). It is now (nearly) as fast as a builtin function!

There are however a few problems (and I have not solved all of them):
1) When the parent program changes directories, the child stays in the directory it started in (the current directory and disk are saved somewhere on the basepage, start+55?).
2) There is also a problem with the memory; the loaded child obtains, as usual the rest of the memory available (in addresses basepage+4 to basepage+7 the address of the 'next free location' or something like that is found: 0xF8000 on my 520 ST+). Thus there is a problem with multiple preloaded childs or childs requesting additional memory. I've overcome this (sort of) by using setblock

(gemdos 0x4a) and adjusting the 'next_free_location' ptrs on the childs basepages. It's better now, but still buggy (I don't know all about Gemdos memory management, I'm finding out now).
3) There could be problems as well with file descriptors (they're also on the basepage).
4) Initialized static and extern variables do not regain their initial value after a run. This is in consequence of the 'once-only' load. It could be overcome by a) always explicit initializing (by the child process), or
b) make a copy of the initialized data space (by the parent process) and use this to re-initiate from the next time (more expensive, but not breaking existing code).

If you manage to overcome these difficulties, it should not be very hard to code this preloading into a shell (I did it, having still these little problems ...). The shell maintains a list of preloaded programs, their pathname and their fat number and handles loading/executing depending on memory available, programs preloaded etc. Preloaded programs are almost as fast as functions built into the shell.

If anybody has suggestions about the memory management part, or questions 'about the real code', or want examples, please RESPOND! A commented disassembly of the gemdos part of the O.S. would also be great ....

The Kitchener-Waterloo Atari user group, Vector-GTIA,
has a separate 8-bit meeting and 16-bit meeting.
We meet monthly, have special interest groups (SIGs),
associated bulletin boards, and public domain libraries.

I am on the executive of the group
so I should be able to handle most questions or
get replies from the rest of executive.

The group welcomes new members and visitors with
8-bits, 16-bits, or those just curious.

The group currently meets at :
DCS Course Room, Room 2009 (2nd floor)
Math & Computer Building
University of Waterloo

Next Meetings
****
8-bit - 7:00 pm, Wed May 4, 1988
16-bit (ST) - 7:00 pm, Wed May 11, 1988
Games Night - 7:00 pm, Fri May 27, 1988

Hope to see you there,
Dani Roloson
579-3695

So. Go out and buy a PC-Clone and quit bitching in comp.sys.atari.st. It is getting pretty boring hearing nothing but "Jack Tramiel did me wrong."

> PRINT-IT!, another program I coded that never made it to
>market (another story completly) was given to Beta testers... And one day
>I recieve a phone call from a chap I had'nt talked w/ since early 8 bit
>days. We chatted botu' this and that... and, I was told (to my total
>astonishment!) that PRINT-IT! was on bulletin boards in california...
>He downloaded it and showed it to me! And I'm gonna make enough money
>to justify the time and effort put into an application? (har! har!).

Sounds like you have more of a problem with your "Beta testers" than with Atari. Or, do you blame Jack Tramiel for the fact that YOU let your program out to someone without scruples? You can, of course, rant and rave about all of those mean nasty people who buy STs for the sole purpose of pirating software -- but do it somewhere other than in a semi-technical ... no scratch that, THIS newsgroup is really the "I HATE JACK TRAMIEL" newgroup, right?

Your problem is that you should be developing software for another computer. There's an easy solution -- buy another computer and work with it. At least then I won't have to wade through umpteen messages from folks complaining "Jack Tramiel did me wrong".

>A mac II developers system was/is able to be had for $3500... Apple has
>an upgrade for AUX thats free... a total motherboard replacement...

There, you see. I thought you could find a computer that suits you more than the Atari ST. Buy a Macintosh and program using AUX (fully realizing that the folks who shell out $$ for a Mac II running A/UX will expect your program to be worth running on their $7500-$10,000 machine.)

>cheers... Rick

I understand how difficult it is to market software -- even for computers with great support. I understand how frustrating Atari management can get. I just do not want to hear it, day in and day out, in this particular forum. There are other things to do than hear people carp about a hardware company.

>Magic Sac

Not exactly true. You *can* run the Translator One box without a Magic Sac.
There is at least one shareware program on the program disk that comes with
the Translator One which allows you to transfer files from Macintosh to
GEM format. (I think the author asks for $ to register and get the "full
function" program that allows transfers from GEM to Macintosh.) The
program runs under GEM, and no Macintosh ROMs are used, so you don't "need"
a Magic Sac. [Though I *will* say that the Magic Sac is quite nice in
and of itself].

3658. Re: ST ROM and Charset Differences: US, French, German, UK, ??

Newsgroup: comp.sys.atari.st
Date: 1988-05-02 16:12:02 UTC
From: gert@prls.UUCP
Message-ID: <11124@prls.UUCP>
Source record: 252558

I compared the UK ROM's dated 851120 to my USA ROM's (when living in
Europe in 1986). The only differences where minor (tables, not routines)
and are listed below.
These where the ONLY differences in the first ROM release to Atari owners
in the Netherlands and UK versus USA. I seem to remember however that there
was a mistake : these differences did not include a 60Hz -> 50 Hz patch,
which later ROM's do have (?).

address USA ROM UK ROM Comment

$FC001D $00 $07 config byte
$FC205F $5C $23 keytable \ -> ♯
$FC2094 $00 $5C \
$FC20B7 $40 $22 @ -> "
$FC20B8 $23 $9C ♯ -> u.k. pound
$FC20DC $22 $40 " -> @
$FC20DD $7E $FF ~ -> _
$FC20DF $7C $7E | -> ~
$FC2114 $00 $7C |
$FC215F $5C $23 \ -> ♯
$FC2194 $00 $5C \

This shows that - at least for the first ROM release - differences are
minor and only related to tables. Not to addresses of data or code.

> the files I had copied were written in sector #7, and that the first
> allocated cluster started in sector #14, which are the correct values
> for a 3-sector FAT disk!

Does your formatter put a unique (or at least random) serial number on the disk, even when you ask for an MS-DOS boot sector? If it doesn't, you're in trouble. The ST checks the serial number AND NOTHING ELSE to detect media change, and if the serial number is the same, it doesn't reload any of the other information. So if a disk goes from a three-sector FAT to a five-sector FAT without changing its serial number, the ST won't know of the change.

Incidentally, the format code *is* smart enough to set the media's state to "maybe changed" when you format or write to the boot sector. But if the serial number is the same, the state goes from "maybe" to "not changed" without reloading the BPB.

Does MS-DOS *require* the words MS-DOS (or something) in the "OEM" field? It's the last three bytes of this field which TOS uses for the serial number.

I know three sectors is enough for a FAT. One possible explanation for the five-sector FAT is so on a double-sided disk, the first sector of the root directory is on Side 1, not Side 0. Otherwise, you could use a single-sided drive to write to a double-sided disk, until you actually tried to write the data: the file-create could succeed.

That is just one hypothesis; only apple!landon knows for sure. But whether he thought of it or not, it's sufficient justification for me to keep that "feature" in GEMDOS.

>version 1.4 dated January 1, 1985 which is available at lakesys.
>Are there other lisps for the st close to the common lisp standard?

I guess it's time to post this again. XLISP v2.0 for Atari ST, Macintosh, and IBM PC is available for anonymous FTP on host cs.orst.edu, in the directory pub/xlisp. If the operators of the archives at lakesys.UUCP will contact me, I will be happy to mail the ST stuff to them so those without FTP access can get XLISP v2.0.

BTW, the functions that XLISP v2.0 implements are compatible with those in Common LISP (of course, the object stuff is not in Common LISP). But XLISP v2.0 does not include all of Common LISP (in particular, defstruct is missing -- sigh).

>Word Processer (Word Perfect (which has just put out another upgrade)),
> ... [rest deleted]
> Matthew Seitz
> seitz@cory.berkeley.edu

Something I want to add about the new upgrade from WordPerfect.
I can't say that I've tested it extensively, but what time I have
had for testing it have shown that:

in general, the text display routines are faster than before, perhaps
not more than 5% to 10% faster, but it's noticeable
scrolling from one end of the document to the other is also faster.
I timed it to be 12 seconds from top to bottom, 8 from bottom
to top, on an 82K document.
scrolling, in general, is also faster. If you hold down <Shift>-
<DwnArrow> or <Up>, the program will wait until you stop,
then figure out where you are, and just show that screen,
instead of showing all the screens in between where you
start and where you end. I'm sorry if that's not very
clear, but trust me, it's faster.
Help is now an option under the Special menu, for those people who
want to touch the keyboard as little as possible
all those places where it used to say <PgDwn> or other incompre-
hensible things now have the correct ST equivalent, so
that <PgDwn> is now <Ctrl-DwnArrow>
an additional file has been added to generate correct Postscript
output (I haven't been able to test this yet)
and overall, all the little "nits" I've had to pick with it have
been fixed.

The other nice thing about this very nice upgrade is that it came with a
letter which claims that this (April 29) is not the final version, and
that they are working on another one. Frankly, I can think of very little
for them to improve now, unless they upgrade to v4.2 or 5.0.

A main point of this article is that, even is WordPerfect Corp. is
an exception, at least here is one "major" software company that is committed
to the ST, and I am very satisfied with their product. I would urge anyone
who needs a "full-blown" word processor to take a look at WP; I think

you'll like it.

3664. dvist

Newsgroup: comp.sys.atari.st
Date: 1988-05-02 20:12:38 UTC
From: mrd@sun.mcs.clarkson.edu
Message-ID: <865@sun.mcs.clarkson.edu>
Source record: 252564

I just downloaded dvist which was posted to comp.sources.atari.st

Well... I can't get it to work. There are two programs dvistdl and dvistnd and I haven't the faintest idea what the differences are between the two (they aren't documented). When I try to run either one it says that /fonts/cmbx10/157pk can't be found. This is very reasonable as I don't have it, but I shouldn't have to have it. You see it should be loading cmbx10@magstep3 for 96dpi that translates to 166pk. For it to comeout as 157 you need to have ~91dpi fonts. As the old version of dvist (1.0-) processes the same file just fine, I am a little confused. Does anyone know how to fix this? What is wrong. Where I can get a copy that works?

thankyou

Subject: Magic Sac performance and prices

[This probably isn't necessary for Bitnet folks but what-the-hell, eh?]

Does anyone here own the Magic Sac cartridge? I'm considering buying it
but I'd like to hear more about it if possible. I'd be very thankful if
people could answer any if not all of the following questions:

a) How fast does it run? I've seen one software-only Mac emulator (it
was apparently illegal) that was very slow. The mouse would jump all
over the place because it couldn't keep up with its speed. I'm
assuming that the Magic Sac is a more professional system than this
hack. Is the mouse movement just as smooth as on an ST?
b) How well does the Translator work? And how good is the disk
performance compared to a real Mac and compared to the normal ST?
c) Does Turbo Pascal run on it without problems?
d) Does the larger screen resolution affect programs poorly? (I know some
programs [including the Mac desktop] can take advantage of the larger
screen but how many other programs choke on it?)
e) How expensive are Magic Sac upgrades? I've heard good things about
how fast David Small gets bugs fixed and adds new improvements, so
how much will it cost me to get the newer versions once I have bought
the current one?
f) Is there a very reliable dealer of the Sac + Mac ROMs?
g) Does Mr. Small have plans of eventually getting the Sac to work with
the latest ROM release? (Isn't that the SE version?)

Respond however you wish. I'm sure there are lots of people who are
interested in these questions besides myself. (But direct mail to me
sure gets here faster than the digests do...)

I hate to say it but I might just have to "convert" my ST system into
a Mac clone. The Mac has Turbo Pascal out for it and lots more support,
and I personally feel that its interface is much prettier than the ST's,
so there are some good reasons to get the Sac. However, I've put lots
of time into an ST project of mine that would probably be fairly hard
to port. I'd probably continue its development on the Atari but
eventually slowly make a Mac version as well.

Thanks to everyone who responds!

3667. ST version of zoo?

Newsgroup: comp.sys.atari.st
Date: 1988-05-02 20:48:44 UTC
From: rogers@ncrcce.StPaul.NCR.COM
Message-ID: <676@ncrcce.StPaul.NCR.COM>
Source record: 252567

Is there an ST version of the "zoo" archive program? If it exists, where
can I get a copy?

Thanks,
--

> software and synchronize it with the VBI and get the
> same effect.

However, the hardware scrolling takes up (alot) less processor time than
the software method. This is it's main advantage! I know you can only scroll
a 25 line screen with it, but the speed achieved cannot be equaled by any
of these "scroll as many times as the user lets you" methods.

> - Doesn't work in 50 line mode on monochrome screens.

Never said it did!

> - As soon as you start having portions of the screen which

I agree, your Uniterm wouldn't benefit from this method.

> text anymore!"
> it's not realy useful, typically 40 to 50 lines/second
> give a pleasing (and half legible) effect (Tempus does
> ~46 lines/second on normal text with full size window).

The method wasn't suggested as "the fastest and the only that you
need use ever again", it is merely another method. Albeit the fastest!
When I say fastest I mean, the method that uses up the least processor time
(a factor which is pretty important in a lot of programs); not the method which
produces the fastest line movement (which incidentaly, it does also do).
A lot of programs which are written for speed, lose a considerable
proportion of their speed on the output of data. If they used hardware
scrolling they could devote more of the processor time to the job inhand than
the actual outputting of results. This is the factor that first prompted
me to write a hardware scrolling routine. I was timing a "super fast" (?)
prime number generator, out of curiousity. It took 3 seconds to produce

it's list of numbers when it was outputting them to the screen and less than one when it didn't do any outputting. Quite a difference, don't you agree? Well okay I'm a bit of a speed freak (like to make the best use of the processor not an amphetamine addict).

> screwy screen if I did not crash. How did you get around that?

I'm not quite sure what your problem is. If you do displace the screen
by, say, 256 bytes while the desktop is being displayed you do get a "really
screwy screen". This is due to each raster line of the screen requiring
160 bytes in colour and 80 bytes in monochrome. So this displacment of the
screen puts the display somewhere in the "middle" of a "display line". The
first number that is a multiple of 160, 80 and 256 is 1280, which is
incidentally the amount of memory each character row (on a 25 row display)
occupies. Thus moving the screen by this amount, $500, will displace the
screen by an entire character row. With a careful bit of manipulation this
effect can be turned into a hardware screen scrolling routine.
I don't know about the crashing, the STs not "that" bad.

I think I hear another vote for a "comp.os.minix.atari" sig on
the net. Your sentaments are stongly echoed here. I would like to propose
not only the new sig but maybe a group to coordinate developement of public
domain utilities under Minix. I seems to me that the ST-Minix community would
benifit from coordinated development instead of 15 people working on versions\
of the same thing.

Some people are taking this a little too seriously.

It reminds me of the AT&T customer service joke that raised so
much hell a while back.

It was really meant to be a joke kids. A poke at Atari vaporware
yes, but it's really gotten blown out of control.

A few of you are getting too serious about things. It was supposed
to be a jab about some of the recent flame wars, not a "real" flame.

And for those of you dragging BDT the company into this. If you've
got problems with BDT the company, let BDT people know about it, and
be specific. When I flame Atari for real, I try to present more than
something like "they suck".

As for flaming me personally, go ahead make your best play; I'm always
game for a round.

No, your wrong. DEC also will sell UNIX SYSV for VAXes. Developed in Holmdel,
NJ. Guess who is the major buyer of DEC's SYSV for the VAX? AT&T that's who.

Hmm... Perhaps for home use, but not for business/professional use. One of the major drawbacks with the ST is the difficulty/impossibility of networking them in any way, shape, or form. This is where the Mac kills everything else. Networking has been built into the Mac OS for quite some time now. The IBM PC has it kludged in (Token Ring/NetBIOS, Novell NetSlime, etc) and the ST doesn't have it at all.

Last week, we got two new Mac IIs at work. To hook them up to the AppleTalk in the building so they could print to the two laser printers, all we had to do was plug into the LocalTalk connector and tell the system to use the LaserWriter+ printer resource via the AppleTalk connector. THAT SIMPLE.

> I have found Atari software to fulfill every need I have.

> Database (dbMaster One), spreadsheet (vc), Modula-2 compiler (TDI),
> Drawing (EZ-Draw, again recently upgraded, IBM emulator for doing class
> work which was to be graded on an IBM (PC-Ditto).

I have 5 Mega 2's at work (which I picked). We have recently gotten WordUp for a word processor. The output is really stupendous on the HP LaserJet II. One big problem is that it takes 8-12 minutes to layout and print a page using this setup.

Also, try this: draw a chart using your favorite draw or paint program, then incorporate it into a document on your word processor. On the Mac, you would just cut it to the clipboard, hop into the word processor, and then paste it into the document. You can't do that on the ST yet.

As I said, the ST line has some major holes that need to be filled in to compete in the business/professional market. The hardware that is there is quite adequate for the job, if we could just get the software to talk and work together. And the seperate systems to talk and work together via networks. Sigh. I really hate the idea of paying Apple for being so snotty about everything, but Atari and C= really haven't given us much of an alternative yet.

<
< Unfortunately, you don't know when the whole operation is complete.
< That's why it's dangerous. It gets much worse with removable media, of
< course.

well, there's another answer somewhere between write-through and write-back cache, and that is the idea of having some control over when updates are posted to disk. This works especially well when controlled judiciously. four or five years ago, i had to do an MS-DOS filesystem implementation. the way I did it was that all i/o went through a buffer cache. i arranged to be able to specify how the buffers were to be released to the cache, in one of three ways: 1: buffer was unmodified; 2: mark buffer as modified; 3: write the buffer immediately. another function would write all "dirty" buffers. incremental file allocation was done such that the FATs were released with the second mode. With this scheme (and a little other bookkeeping), it was possible to selectively sweep the cache (thereby updating the cache) only at major checkpoints, such as the final update to the directory entry. i used variations on this scheme in later systems, as well.

Another part of an answer (which I have combined with the above) is to do preallocation. Here, whenever a file is about to undergo automatic extension, the extension can be done in an amount greater than a single cluster (under control of some fixed or variable parameter). this works especially well when contiguous-best-try is used. at file close time (again, along with some bookkeeping), the extra clusters can be released. must less wear and tear on the FAT, better data organization.

| I didn't hear why there was a 4.5 Meg limit.
|
| Well, which is it?

The addressing limit on the ST without hacking the hardware is 4 meg.
The MMU chip does the majority of the address decoding, and it only
deocodes a1..a21. If you "fall off" the end of the MMU, it will
(should?) give you a bus error or address error. This could, of
course, be changed by replacing the MMU chip.

From: Jinfu@cup.portal.com
Message-ID: <5061@cup.portal.com>
Source record: 252579

Let me throw in my cents:

Why can those frustrated ST developers/users sell their STs to recoup some money to buy a Mac or Amiga, or PS/2 and stop whinning here? If you are not happy with the computer, the best thing to do is go for another one and stop crying. Just leave us 'stupid' happy users alone will you?

To offer my best help, I am willing to buy a ST from whoever decides to leave the ST world. My friend is looking for a used ST, it can be a 520 or 1040 in mint condition(i.e. no jumper wires in the mother board, clean memory upgrade is okey), with a double side drive (no 520FTM please). No monitor is needed since he has a NEC multi-sync.

For serious seller, call (612)898-5338(day), or leave me an email to:

Jinfu@cup.portal.com
...sun!portal!cup.portal.com!Jinfu

P.S.

A local rumor says one of the programmers from Jefferson Software (JS Modular-2), Ken (sorry I couldn't remember his last name, his GEnie handle is KBAD), just joined Atari in the third party development support group. Congradulation Ken (if you are reading).

>...a couple ads I've seen, mail order houses were offering double sided
>disks for the same price as for single sided disks. Whether this is
>because DS and SS disks are essentially the same or whether it's for some...

I have been having disk access errors recently with disks that checked
out okay with disk verifying programs. I took this disk and my 1040ST
to my local maintenance guy. After doing some tests, he concluded that
I should stop using my brand of SS disks.

He said many SS disks are verified for the Mac drives which have the
heads on the opposite side as ST's drives. He once tested 100 SS
disks, reading, writing, formatting repeatedly. He determined that
about _20_ of them developed seriously bad data corruptions.

He recommends Sony SS disks, because he says they are verified on both
sides, so that they can be used as SS disks on either Mac or ST or
what-have-you drives. So I am going to trade my disks to someone
with a Mac.

>[...rest of message deleted...]

A few suggestions:
1) Alter the bios, as follows. Save the old bios vector. The new bios vector
must point to a function that does the following:
a) If the bios function is not conout (3 I guess??) jump to the old
vector.
b) If the output device is not the printer jump to the old vector.
c) Now if the character to be printed is one of the graphic esc. sequences for an Epson
fx/mx printer, note this (in variable(s)). Other characters
must be printed using the old vector.
d) At the end of a graphic sequence (use the variable(s)) you print the
corresponding sequence for the LQ-500, using the old vector. You will have to
fiddle somewhat here, because you can't use the old vector as a subroutine
(having a RTE at the end). Et voila! If you want some more detailed information,I suggest
you read the book Tips und Tricks ... from Data Becker; it contains a
bios 'redirection' in the way I just described.
2) Catch the Alt-Help combination yourself, by adding a VBL (vertical blank) interrupt.
Find an empty slot in the list of vertical blank vectors
(a nil pointer). Make it point to a routine of yours that checks on Alt-Help
pressed (this info is kept in a system variable, 0x4??). If so, reset this flag
and print the screen. There is a problem however: you cannot use bios, being in
a interrupt (would cause problems with interrupted bios calls). So you have to
do it using I/O addresses and the like: nice and dirty! I've done something
similar: I use the Alt-Help for a quick dump of my screen. The program is
called FASTDUMP and I'm planning to forward it to the comp.sources.atari.st
group. It scans the screen memory and tries to match on the TOS characters.
If the character matches, it is send out as an ASCII character to the printer.
If not, a space is send (or CR-LF if more appropriate). It is as fast as

printing a file (and thus much faster than graphic dumping). It is very nice for programs that do not have a printer option or for catching e.g. the output of a compiler (or printing a page whilst in the editor). It is also suitable for any printer that can do ASCII characters (and which cannot?); only graphics cannot be printed. If you will have a little patience??

leo.

P.S.: Now I come to think of it, altering the bios won't help if you use Alt-Help; maybe it does when you use the Print File option? I dunno...

Having recieved a few enthousiastic reactions for the Bomb detector program,
here is it. You can run it afterwards whenever a bombing has taken place.
The main pre is that it does not have to be resident and that it is an
ordinary C program (what is ordinary C? :=).

The program is called LASTERR and compiles succesfull on a Lattice-C compiler,
so note that int == 4 bytes, and short == 2 bytes!
It could be cleaned up a bit, replacing the 'magic numbers' by macro's etc.
It is mainly self-explainatory; the data referenced (addresses 0x380 etc.)
have already been filled in by the standard error routine (the one that also
throws bombs).

------------------------------ CUT HERE -------------------------------------

```
/* lasterr.c: report last occured error and stack dump.
* Copyright L.J.M. de Wit, 1988.
* This source and the generated code may be freely distributed, if not used
* commercially.
*/

#define PEEKB(a) (*(unsigned char *)(a))
#define PEEKW(a) (*(unsigned short *)(a))
#define PEEKL(a) (*(unsigned long *)(a))

main()
{
int ssp, i;

ssp = gemdos(0x20,0); /* switch to supervisor mode, save stack pointer */

if (PEEKL(0x380) != 0x12345678) { /* magic marker */
printf("No error occured since last reset\n");
} else {
static char *errmsg[] = {
"Reset", "Reset",
"Bus error",
"Address error",
"Illegal instruction",
"Division by zero",
"CHK",
"TRAPV",
"Privilege violation",
"Trace"
};
short excepno, offset;
```

```
excepno = PEEKB(0x3c4);
offset = ((excepno == 2) || (excepno == 3)) ? 8 : 0;

printf("Exception no. %d (%s)\n",excepno,
(excepno >= sizeof(errmsg)/sizeof(errmsg[0]))
? "Unassigned" : errmsg[excepno]);

for (i = 0; i < 8; i++) {
printf(D%d : %8x\tA%d : %8x\n",
i, PEEKL(0x384 + 4 * i), i, PEEKL(0x3a4 + 4 * i));
}
printf(PC : %8x\tUSP: %8x\nSR : %8x\n",
PEEKL(0x3ce + offset), PEEKL(0x3c8), PEEKW(0x3cc + offset));

if (offset == 8) { /* exceptions 2 and 3 */
short status = PEEKW(0x3cc);
static char *accmode[] = {
"unassigned",
"user mode data reference",
"user mode program reference",
"unassigned",
"unassigned",
"supervisor mode data reference",
"supervisor mode program reference",
"interrupt acknowledge"
};

printf("\nRead/Write : %s\n",
(status & 16) ? "read" : "write");
printf("In-/Extern : %s\n",
(status & 8) ? "extern" : "intern");
printf("Access mode : %s\n",accmode[status & 7]);
printf("Address : %8x\n", PEEKL(0x3ce));
printf("Instruction : %8x\n", PEEKW(0x3d2));
}
}
gemdos(0x20,ssp);
}

------------------------------ CUT HERE -------------------------------------
```

I hope no errors have crept into the source while I was typing it over; but
then, you could use this program to see what bomb was produced (:=)).
Have fun!

leo. (What you C is what you get).

3683. Re: AMIGA disks

> ST then write Amiga-readable disks for them.

I've had no success trying to read Amiga disks on an ST, I don't
think it's possible.
However, there is a PD program out on the Amiga called "DOS to DOS"
which allows an Amiga to format MS-DOS, and ST (in the later versions),
disks. Files can then be easily transfered between Amiga and ST as both
machines can now read these disks, the Amiga because of this piece of software
and the ST as it is able to read MS-DOS formatted disks.
If you get a more recent version of this program, which I believe
has the filename "d2d" (just thought I'd tell you as amiga disks tend to
have lots of files you never knew you had on them), then you can just download
the Amiga PD stuff onto an ST disk and then give this disk to your friends
who will be able to easily transfer the files onto an Amiga disk. If you
have an early version of DOS to DOS which doesn't support ST disks, just
MS-DOS, then you just get a friend to format a few disks to MS-DOS format,
with his/her Amiga, and then you use these disks to download the files onto.
I think (hope) this program is public domain. A friend has got it,
so if it is I'll post it into comp.amiga.binaries in the next week or so.

>Epson printers are rather like IBM computers - they think they're the
>best, so they make their prices higher, even when many other companies
>offer more REAL performance at a significantly lower price.

I can't really complain about Epson pricing, it seems reasonable if you shop well. I CAN AND WILL complain about this though: I bought an Epson LQ-1000 last year, for an employer to use for WP, and this year you can't buy a sheet feeder for the thing! OK, Epson's association with IBM may have taught them arrogance (Gee, those people at IBM know about that!), but you can still buy parts and support for IBM CPU's that are 20 years old. This printer was new last year and this year you can't get a sheet feeder for it? Well, Epson, if you want to play tag-along, play by the rules of the people you tag along with!

Anyone know of a vendor that sells "old" Epson hardware that Epson doesn't sell anymore?

>ideas?

Yes. In a word: Mediachange.

It is quite probable that you had an MS-DOS disk in the drive with three
sector FATs, removed it, put in an MS-DOS disk with five sector FATs, and
attempted to write on it. This is a sure-fire path to a trashed disk.

MS-DOS does not use disk serial numbers. The ST does. When the ST hardware detects a possible media change (a state change in the write-protect sensor), it sets the disk status to "Media-may-have-changed". When the disk is next accessed, the O/S checks the serial number of the disk to see if it is the same disk, or if it really has changed. If the serial number is the same, the O/S concludes that the disk did not change, and continues read/write operations based on the known disk parameters. In this case, that meant a disk with three sector FATs.

The MS-DOS disk boot sector contains a field for "O/S-ID", which will contain something like "IBM 3.2" or "IBM 3.3" or the like. The last three bytes, the "3.2" or whatever, are the same three bytes the ST uses for the disk serial number. When you change disks, from one MS-DOS disk to another, the ST's O/S sees the same serial number, and concludes that the disk has not been changed. Note that just insuring all your MS-DOS disks are formatted the same is no solution, since one may have files on it, and when a change is made, the new disk will not have the same sectors in use.

What to do:

Ounce-of-prevention-method:
Don't use MS-DOS boot sectors unless you absolutely have to. They are a non-standard disk, as far as the ST is concerned, since they have no serial number.

Pound-of-cure-method:

1) Label all disks with MS-DOS boot sectors as being MS-DOS disks.
2) Whenever you remove one from your ST, immediately insert a standard format ST disk, and force a read of it (directory, or show info).
That will insure that a media change has been detected, and that if you next insert another MS-DOS disk, another media change will be detected.

Note that a five sector FAT is standard on the ST, and DCFORMAT is providing you with the standard configuration on the disk. That does not constitute a bug in DCFORMAT, in my opinion.

*** Bun Warmer ON *** (Weak sort of flame)

Not directed specifically at Mr. Heinz, but at anyone who puts non-standard anything into any computer, then expects the computer to magically cure all their problems.

All computers, from a Sinclair to a Cray, expect to operate in an environment that conforms to the standards for that system. When you alter their working environment to something that does not meet their standards, the onus of insuring that things will work falls directly on you.

For the ST, specifically, standards include 9 sectors per track, 80 tracks, and unique serial numbers on disks. The utilities built into the ST will provide disks that meet those standards. It is not reasonable to expect that the built in features of the machine can figure out that you have 10 or eleven sectors, 81 or 82 tracks, or all your disks serial numbered the same.

And I won't start on software that alters system variables directly rather
than via system calls.....

3687. laser printers on ST - query for experience

Newsgroup: comp.sys.atari.st
Date: 1988-05-03 13:23:11 UTC
From: toml@xrxns.UUCP
Message-ID: <282@xrxns.UUCP>
Source record: 252587

i am thinking seriously about investing in a laser printer, both for personal and professional use. applications include text and graphics, desktop publishing, software development, and anything else i can think of which is fun and/or profitable.

i am interested in hearing of the experience of others in coaxing laser-quality output out of their atari st's. naturally one of the biggest decisions i have to make is whether to opt for a postscript printer or not. money is definitely an issue, but a useful future may prevail over a short life and saved money.

key questions i have are: what packages support postscript output? and the followup, what packages can drive non-postscript lasers, e.g. hp laserjet, and cheaper lasers like the kyocera, okidata, etc. what about interfacing - any problems with any particular machines?

i'm interested in (but don't yet own) wordperfect, softlogik's desktop publishing package (can't recall the name), cyber-stuff, easy-draw, and any of a variety of databases/spreadsheets/etc.

i guess the two machines at the top of my list are the apple laserwriter plus, which seems to be available used for around $2500, and the hp laserjet 2 which is available new for around 1700 or so. i view postscript as an attractive selling point for the apple printer. other postscript printers don't seem to be available used, and all the postscript printers cost too much new for me to consider.

anyone have any experience with hp's deskjet yet?

just a cry in the wilderness for some advice. please mail me or respond here - my mail path is a bit convoluted. thanks.

3689. Picture Formats!!

Newsgroup: comp.sys.atari.st
Date: 1988-05-03 16:09:43 UTC
From: dmb@TIS.COM
Message-ID: <8805031609.AA01371@TIS.COM>
Source record: 252588

A while back I asked about picture formats. Thanks to all who responded.
Since *lots* of people have being asking about formats, I compiled all
the format descriptions and rewrote them. Hopefully, they're coherent and
correct. Please report errors in the file to me (dmb@tis.com).
Here 'tis:

---------------------------Cut Here--
ST Picture Formats

Introductory information

word = 2 bytes
long = 4 bytes
palette = Hardware color palette, stored as 16 words. First word is
color register zero (background), last word is color register
15. Each word has the form:

Bit: (MSB) 15 14 13 12 11 10 09 08 07 06 05 04 03 02 01 00 (LSB)
-- -- -- -- -- -- -- -- -- -- -- -- -- -- -- --
0 0 0 0 0 R2 R1 R0 0 G2 G1 G0 0 B2 B1 B0

R2 = MSB of red intensity
R0 = LSB of red intensity

G2 = MSB of green intensity
G0 = LSB of green intensity

B2 = MSB of blue intensity
B0 = LSB of blue intensity

Intensity ranges from 0 (color not present) to 7 (highest
intensity).

Example: { red = 7, green = 3, blue = 5 } -> 0735 (hex)

The Formats

<NEOChrome>

1 long resolution (0 = low res, 1 = medium res, 2 = high res)
16 words palette
12 bytes filename (" . ")
1 byte Left color animation limit (starting color number)
1 byte Right color animation limit (ending color number)
1 byte color rotation speed
1 byte color rotation direction
1 word color rotation duration (number of iterations)

```
18 longs reserved for expansion
16000 words picture data (screen memory)
-----------
32128 bytes total

<DEGAS>

1 word resolution (0 = high res, 1 = medium res, 2 = low res)
16 words palette
16000 words picture data (screen memory)
-----------
32034 bytes total

<DEGAS Elite>

1 word resolution (0 = high res, 1 = medium res, 2 = low res)
16 words palette
16000 words picture data (screen memory)
4 words left color animtion limit table (starting color numbers)
4 words right color animation limit table (ending color numbers)
4 words animation channel direction flag (0 = left, 1 = off, 2 = right)
4 words animation channel delay in 1/60's of a second. [0 - 128]
-----------
32066 bytes total

<C.O.L.R. Object Editor Mural>

16000 words picture data (screen memory)
-----------
32000 bytes total

<Tiny>

1 byte resolution (same as NEO, but +3 indicates rotation
information follows)

If resolution > 2 {
1 byte left and right color animation limits. High 4 bits
hold left (start) limit; low 4 bits hold right (end)
limit
1 byte direction and speed of color animation (negative value
indicates left, positive indicates right, absolute value
is delay in 1/60's of a second.
1 word color rotation duration (number of iterations)
}

1 word number of control bytes
1 word number of data bytes
16 words palette
3-10667 bytes control bytes
2-32000 bytes data bytes
-------------
42-32044 bytes total
```

Control byte meanings:

For a given control byte, x:

x < 0 Absolute value specifies the number of unique words to
take from the data section (from 1 to 127)
x = 0 1 long is taken from the control section which specifies
the number of times to repeat the next data word (from
128 to 32767)
x = 1 1 word is taken from the control section which specifies
the number of unique words to be taken from the data
section (from 128 - 32767)
x > 1 Specifies the number of times to repeat the next word
taken from the data section (from 2 to 127)

<Spectrum 512 (Uncompressed)>

80 words First scan line of picture (unused) -- should be zeroes
15920 words picture data (screen memory) for scan lines 1 through 199
9552 words 3 palettes for each scan line (the top scan line is
not included because Spectrum 512 can't display it)

51104 bytes total

<Spectrum 512 (Compressed)>

1 word 5350 (hex) ("SP")
1 word 0 (reserved for future use)
1 long length of data bit map
1 long length of color bit map
<= 32092 bytes compressed data bit map
<= 17910 bytes compressed color bit map

< 50014 bytes total

Data compression:

Compression is via a modified run length encoding (RLE) scheme. The
data map is stored as a sequence of records. Each record consists of a
header byte followed by one or more data bytes. The meaning of the header
byte is as follows:

For a given header byte, x:

0 <= x < 127 Use the next x + 1 bytes literally (no repetition)
-128 <= x < 0 Use the next byte -x + 2 times

The data appears in the following order:

1. Picture data, bit plane 0, scan lines 1 - 199
2. Picture data, bit plane 1, scan lines 1 - 199
3. Picture data, bit plane 2, scan lines 1 - 199
4. Picture data, bit plane 3, scan lines 1 - 199

Decompression of data ends when 31840 data bytes have been used.

Color map decompression:

Each 16-word palette is compressed separately. There are three
palettes for each scan line (597 total). The color map is stored as a
sequence of records. Each record starts with a 1-word bit vector which
specifies which of the 16 palette entries are included in the data
following the bit vector (1 = included, 0 = not included; i.e., stays
the same). The least significant bit of the bit vector refers to
palette entry zero, while the most significant bit refers to palette
entry 15. Bit 15 must be zero, since Spectrum 512 does not use palette
entry 15. Bit 0 should also be zero, since Spectrum 512 always makes the
background color black.
The words specifying the values for the palette entries indicated in
the bit vector follow the bit vector itself, in order (0 - 15).

>

I have a similar problem with my LaserJet Series II. It works fine with my Epson IBM Clone, but refuses to print anything sent by my ST. The problem lies in the termination resistors in the HP. Their values are < 2 kOhm, and require more current to drive than the Yamaha chip in the ST can deliver. The solution, according to Atari's Service Bulletin (I saw a copy this week-end), is to replace the termination resistors in the printer with higher valued resistors >3.3 kOhm, [or buy an Atari printer ;^)].

I tried replacing the 1 kOhm pull-up R107 (I think) on my ST mother board with other values to no avail. At least I have an out of using the serial port on the LaserJet with my ST. I don't believe the DeskJet has one.

I know this doesn't solve your problem, but I hope it answers your question.

Oh, incidently, I'm told that not all STs exhibit this behavior. Wonderful, no? I've already had to replace my marginal DMA chip so I could communicate with my Hard Disk, my MMU [sic] so I could run Spectrum, and now they tell me I need to replace my Laser Printer! :^|

There are some excellent video games for the ST. Atari's own Star Raiders has been updated and enhanced to take advantage of the graphics capabilities of the ST. It has the feel of the original with lots of pretty little touches added, like multiple simulated "computer displays" within the main window...

>Sometimes people ask, "If you knew when you bought your Atari, what you
>know now, would you have bought it?
>
>My answer is YES!YES!YES!YES!YES!YES! I love my Atari!!!!!!

Well, this brings up an excellent point: why did YOU buy this machine?

Mr. Beckemeyer apparently chose the machine because it was the fastest, cheapest 68000 box around and he intended to concentrate on that aspect of it; unfortunately in his enthusiasm or niavete he either overlooked the machine's designed-in limitations (no external bus connections, buggy OS ROMS), or underestimated their impact on the power of the machine. Now he bemoans the fact the Atari is slow in fixing things. Did Atari hold a gun to your head, and force you to develop for their machine, Mr. Beckemeyer? It was your choice. If it was a bad one, then move on. No one likes sour grapes.

I chose the machine for several reasons. I had been working with an S-100 bus system based on a Z80-A computer, running CP/M 2.2. I was tired of hitting the limits of the Z80's speed and memory. The graphics board I had was limited to 265 x 192 resolution with a fixed palette of 16 colors (based on the TI9918A chip). I could see the possibilities with more speed, more memory, better graphics.

Then, along come both the Amiga and Atari. Both are based on 68000's, with its large linear address space, rational register architecture and instruction set. The Atari is available, stock with a MEGAbyte of memory (ye gods! How could I EVER fill that up? :-). The screen

resolutions are nearly double what I had. The prices are within my budget. Now, how to choose?

At the time (about two years ago), all the talk on the Amiga side was about how buggy the operating system is, how slow the file management is, what a pain Kickstart is, etc. So I bought Atari. Now, to my sardonic amusement, all the talk in Atariland is about how buggy TOS is, how slow FAT searching is, where is the blitter, etc! And Amigaland? Well, they get their OS updates on disk, so they're WAY ahead of where they were 2 years ago! So knowing what I know now, I would probably buy an Amiga, maybe... except that there have been a number of EXCELLENT software packages published exclusivly for the Atari, such as Antic Publishing's Cyber Studio. This stuff is EXACTLY what I wanted the computer for.

Personally, I haven't found any of the TOS bugs fatal; except that I don't have a hard disk so I stand to loose less than others. I don't mind that the floppies aren't as fast as they could be, since they hold 1/3 more data (800K vs. 600K) than my 8" floppies, in a fraction of the space. I do wish Atari would release new ROMS, and a blitter mod for the 1040, but I never had a blitter before (hell, I had to write my own graphics routines from the SET/GET PIXEL level on up!). I guess I can live without one for a while longer...

P.S. Apologies to Mr. Beckemeyer if I have misspelled your name. I do not have your posting in front of me. If I have, and it makes you feel any better, feel free to misspell mine.

In article <476@philmds.UUCP> leo@philmds.UUCP (L.J.M. de Wit) writes:
> 1) Alter the bios, as follows... (much follows)

- actually replacing the screen dump routine is rather simple, since there is a vector to it (albeit not well publicized). The LONG at the address $502 points to the standard routine, called by both the Alt-Help mechanism and the XBIOS Scrdmp() function (in turn called by various paint programs). You can simply replace the contents of that vector with the address of your custom screen dumper, which should be a Terminate-and-stay-resident TOS program you can place in the auto folder. You have to do something to avoid reentry of the actual dump code if one presses Alt-help while the dump is in progress. Also, you should provide for abortion on request or if the printer does not respond.

I have actually written such a beast for my printer (an Apple Dot Matrix, no kiddin!) (which is really a modified NEC 8023), so if there is much demand I can post the source code. Warning: it is in assembly language.

3694. German MS-DOS emulator

Newsgroup: comp.sys.atari.st
Date: 1988-05-03 21:34:55 UTC
From: rob@hhb.UUCP
Message-ID: <956@hhb.UUCP>
Source record: 252593

[This space intentionally not blank.]

I recently got a copy of the May 88 issue of the German magazine c't,
and it has several articles about the ST. I have translated one of the
articles for those of you interested in MS-DOS emulation:

At CeBit, ABD Electronic introduced the Supercharger, a 'co-computer'
for the Atari ST. The equipment shown consisted of a single-board computer
with an 8086, sockets for an 8087 and one Meg RAM, and working at a clock rate
of 8 MHz. It comes complete with MS-DOS 3.2, a power supply, and a cable
to connect it to the DMA port on the ST. The communication is handled by a
gate-array.
Since the equipment at the fair contained a prototype gate-array afflicted
with errors, we restricted ourselves to the arithmetic benchmarks
(c't 10/87, S.104). The Turbo-Pascal version gave the following results:

INTM: 0.72 sec.
REALM: 33.50 sec.
TRIG: 47.80 sec.

The Supercharger seems to be somewhat faster than a standard XT at 4.77 MHz.
June availability is anticipated; because of the increasing cost of memory
chips the existing pricing of close to 700 DM might be surpassed by about
100 Marks.

The program is DOS-2-DOS from:

Central Coast Software
286 Bowie Drive
Los Osos, California 93402
Phone: (805) 528-4906

I frequently use it to exchange data between my Amiga and the PC at
work. The documentation also claims the capability to read ST floppies.
I don't think it can read Mac disks though.

From: tyler@stpl.UUCP
Message-ID: <143@stpl.UUCP>
Source record: 252598

In article <865@sun.mcs.clarkson.edu> mrd@sun.mcs.clarkson.edu (Michael R. DeCorte) writes:
>
>I just downloaded dvist which was posted to comp.sources.atari.st
>
>Well... I can't get it to work. There are two programs dvistdl and
>dvistnd and I haven't the faintest idea what the differences are
>between the two (they aren't documented).

Well, the two versions are very similar but one
loads only those characters that are required, and the
other loads the entire font set regardless of what is used (the dl = demand load). The server works well with the former, and the latter works best when the fonts are available on the ST.

Time for a poor excuse for the poor documentation. A great many people have requested the new version of the program for the last while and we have been promising that it would be out "next week". Well "next week" had come and gone (more than a few times) and we felt that the functional differences between the versions were small enough to avoid a great deal of confusion and that the original file with a small addendum would be sufficient. I suspect that we were incorrect and I apologise for that but time is scarce right now. Besides, we felt that we provided the ultimate documentation -- the source! However, I thought that I described some of this as an addendum in the .dvi and the .tex file....Hmmmm I had better check the distribution again!

> When I try to run either
>one it says that /fonts/cmbx10/157pk can't be found. This is very
>reasonable as I don't have it, but I shouldn't have to have it. You
>see it should be loading cmbx10@magstep3 for 96dpi that translates to
>166pk. For it to comeout as 157 you need to have ~91dpi fonts. As
>the old version of dvist (1.0-) processes the same file just fine, I
>am a little confused. Does anyone know how to fix this? What is
>wrong. Where I can get a copy that works?

Here again, a functional difference between the old version and this one pops out. In this version the system will search for the font file, in this case 157pk and if it can't find it, a search for a font +/- 10pk will be performed. The error message reports the last font name that it had attempted to open. However, this doesn't explain why it didn't find the file 157pk. I'll take a wild guess that the dvist.rc startup file does not contain the correct search path-list.

BTW a help message can be obtained with the '?' key while running the previewer or with the -h option when invoked.

Finally assuming that you have a good archive but that somehow
the programs are corrupt, you can alway recompile them from the source
(assuming that you have the Alcyon compiler).

P.S.
The email uucp address for both Avy and myself has changed
as our connectivity has changed recently.

Avy: ...mnetor!yunexus!yugas!avy Tyler ...mnetor!yunexus!stpl!tyler
...utzoo! ...utzoo!

P.P.S.
Avy and I plan to release the Atari Laser printer version
soon. However we are having trouble with speed. Right now we are
lucky if we can print out 2 ppm. Compare that to our HP laserjet
version that can dump out the printers maximum rate (I believe it
is 8ppm). We are also going to place a print preview into the
screen preview program and will release the new atari.h when completed.

Yes. Possible.

>This is something I've been waiting for it to come out, and now I see
>Electronic Arts has done it on the Amiga. I think the colloquial term
>is genlock. If anyone knows how long until it comes out on the Atari or
>how much it costs, please tell me, I am very interested.

The ST has one built in, one nobody seems to know about.

You can configure the SHIFTER Chip to take the HSync and VSync lines as
an input rather than output (external syncronisation).
If your VCR provides the synchron signals (possibly with an EURO
AV/SCART connector) just feed them into your ST, switch to external sync
and look at the picture on the monitor: it is a superposition.

I did this (for fun) with the pictures of two STs: resolution of 640*200
by 512*512 colors! Wonderful (almost Amiga)!

3699. Re: Magic Sac performance and prices

Newsgroup: comp.sys.atari.st
Date: 1988-05-04 03:06:24 UTC
From: Thomas_E_Zerucha@cup.portal.com
Message-ID: <5087@cup.portal.com>
Source record: 252600

I have a magic Sac, and it makes my ST run Mac software better than a real Mac in some cases (larger screen, 8 Mhz v.s 5.77(?), fast disk access). It reads any mac formatted disk with the translator, however formatting using the translator may not work on any given mac. Turbo Pascal might run, but I am not sure. I use lightspeed C with no problems. There are a lot of minor problems (no 128K rom-only software (yet), hardware accesses cause crashes), but overall, I can get away without a mac.

3700. netlib index

To request files send a message to netlib@lakesys.UUCP consisting of:
```

send filename/part.uaa from archives.atari
send filename/part.uab from archives.atari
send filename/part.uac from archives.atari
etc.

If the file is found in one of the new volumes, (the example is volume 1) the
syntax is:

send volume1/filename/part.uaa from archives.atari
send volume1/filename/part.uab from archives.atari
send volume1/filename/part.uac from archives.atari
etc.

Note there is no space between the word "volume" and the number of the volume.

Subject for the message is not necessary.

Use the form above to assure that the parts will arrive as separate messages.
Parts are approximately 50k each.

This index can be obtained by sending:

send index from archives.atari

to netlib@lakesys.UUCP

A path which has proven to be successful for some users is:

From: landay@cory.Berkeley.EDU
Message-ID: <3002@pasteur.Berkeley.Edu>
Source record: 252503

It has already been discussed what a problem it would be to get a
68020 working in the ST. Now that Motorola has announced a 16MHz version
of the 68000 (for less than $40 in quantity of ~400) I was wondering
what it would take to get one of these working in place of the 68000.
(Alan?)

Does anyone have the public domain program CALLTIME. It is supposed to log (through time and date stamp on screen and printer) calls to your answering machine. It was mentioned to be on a public domain disk put out by ST Informer. If you have it could you email it to me or if there is interest post it to the binaries group.

thanks

Postings with this heading a trailing off, thankfully....

Developers and users who are unhappy with Atari should realise that all of the yelling in the world isn't going to make much difference. GEM for the ST still is has the same problems it had when it was first released (over two years ago). Many people have pointed out problems, and a few have supplied work arounds. But nothing from Atari.

I strongly recommend that these people sell their machines, and buy something from a company that will support their product. Quit wasting your time and money.

Those who like their ST's, accept things as they are, and work from there. I wish you the best of luck, really. The ST does have a few strengths. It is a pity that Atari has failed to exploit them fully (at least in the US).

Me? I had thought of buying a 520ST to run Magic Sac on and keep my Amiga 2000 company. Now? No way, jose'.

I believe that the latest version of MX2 includes a file server which
uses the midi port, or so that documentation implied. This is another
possibility you may want to investigate. MX2 seems much less complete
and "polished" than RTX, but it's less expensive.

Aaaah.. such strange incantations in attempt to divine if one was executed
from the desktop, or elsewhere. Yes, this is a useful thing to know. Many
times I've wished programs were written to pause before exit, but NOT if
they're run from a shell. Following a suggestion given to me by Allan
Pratt, I've come up with a fairly clean way to determine this information.
The idea is this; Your process basepage contains a pointer to your parent
process. By tracing the parent->parent chain, you should be able to
gather enough information to determine where you came from. In order to
attempt to make this portable to other ROMs, you should NOT depend on
the desktop to reside at a specific location. The approach I use is to
check to see if your parent's text base is in high-memory ROM, and if so,
count the number of levels deep you are in the parent chain. The three
cases I look for are; Auto folder, which is shallow and in ROM; Desktop,
which is one level deeper than Auto and in ROM; and shell, which is not

in ROM at all. I admit that this is not fool-proof. If future OS versions change the number of nesting levels for default processes, or if the OS is RAM loaded, this method will fail, but for now it works on the 520/1040ST and it should work on the Mega. The following C program demonstrates...

```
/*
* camefrom -- tell what our parent process was.
*/

#include <stdio.h>
#include <basepage.h>

#define FROM_AUTO (-1)
#define FROM_SHELL (0)
#define FROM_DESKTOP (1)

main()
{
register int from;

printf("camefrom() = ");
switch(from = camefrom())
{
case FROM_AUTO:
puts("\AUTO folder.");
break;
case FROM_SHELL:
puts("a shell program.");
break;
case FROM_DESKTOP:
puts("the desktop.");
break;
default:
puts("outer space.");
break;
}
if(from)
{
printf("Hit [RETURN]...");
getch();
}
}

camefrom()
{
register BASEPAGE *p = _base;
register int n = 0;

p = p->p_parent;
if((((long) (p->p_tbase)) & 0x800000L) == 0L)
return(FROM_SHELL);
while(p = p->p_parent)
```

```
++n;
return((n == 1) ? FROM_AUTO : ((n == 2) ? FROM_DESKTOP : FROM_SHELL));
}
```

>Ken Newman
>Big Electric Cat Public UNIX
>..!cmcl2!phri!dasys1!newman

Here's how keyboard buffering is done (at least I thought so ...) :
The keyboard ACIA chip reads the keyboard and makes the characters available
at an I/O address (0xFF????). The processor, as part of the VBL routine,
reads the byte at that address (if the status, another I/O address is O.K.)
and places it in a buffer, let's call it the terminal I/O buffer.
This buffer is used by the BIOS for reading a single character and testing
availability of a character; also GEMDOS uses it to read a single character
with/without echo and to read a complete line with editing capabilities (I
think these are your Crawcin() and Bconin()). I don't quite see why you
should need direct access to the terminal I/O buffer; you can use bios
calls to check availability of a character (or use something like kb_hit())
and if there's a character, store it in your buffer. It could however be
possible that you just want to look at characters in the buffer, and not
mark them read, so here is some code (I used it to trap control C's: I can
now use stdio without control C terminating the program - a shell):

/* sh.prg */
.
.
.
#define TRUE 1
#define FALSE 0

#define CONTROLC 0x2e0003
#define CONTROLQ 0x100011
#define CONTROLS 0x1f0013

typedef struct iorec {
char *ibuf;
short ibufsize, ibufhead, ibuftail, ibuflow, ibufhigh;
```

```
} iorec;

typedef unsigned char bool;
.
.
.
iorec *iop;
.
.
.
iop = (iorec *)xbios(14,1); /* get ptr. to terminal I/O buffer structure */
.
.
.
bool test_ctrlc() /* test for control C; discard buffer if you see one */
{
int i;

for (i = iop->ibufhead; i != iop->ibuftail; ) {
i += 4;
if (i == iop->ibufsize) {
i = 0;
}
if (*(int *)(iop->ibuf + i) == CONTROLC) { /* had one */
iop->ibufhead = iop->ibuftail; /* effectively clears the buffer */
return (bool)TRUE;
}
}
return (bool)FALSE;
}

Some remarks:
a) Lattice has int == 4 bytes, short == 2 (Megamax I thought int == 2).
So you should replace the *(int *) by *(long *), and the short by int.
b) The buffer struct contains:
ibuf: start of the buffer
ibuftail: index of write position
ibufhead: index of read position
ibuflow : index of low water mark
ibufhigh: index of high water mark
Each character is stored as a (4-byte) int, the scancode in the high
word, the ASCII code in the low word. This is the same int as you get
from gemdos(7) (character in without echo). Note that old BIOS versions
used 2 bytes int to store a character (I know, I had TOS in RAM!), so
there may be portability problems (i.e. between Ataris).
c) An empty buffer is indicated by ibufhead == ibuftail.
d) The xbios call returns a pointer to the structure.
e) It would have been possible to define ibuf as (int *); the trouble is
that then the indexes have to be converted (being byte-offsets).
f) Of course, you can also use gets() or fgets(ptr,size,stdin) to read
a line or use gemdos(10) (READLINE), but that is not very raw; several
```

characters are interpreted and there must be a termination character
(mostly Newline).

I hope this helps and is raw enough? Have a nice byte (%-) !
(please mail me if not).

Leo. (What you C is what you get).

I too have a related problem. I have an ST and a 386 clone hooked up to
a Citizen MSP-20. Both machines can talk to the printer just fine when
cabled directly, but if I put a switch box in between, then the ST
wont talk to it....

Source record: 252510

[I'm not one to send messages like this but this irritates me so that I thought I should share it and possibly warn others.]

Exactly 92 days after purchasing my SH204 hard disk, it failed to spin up. Of course, the 90 day Atari warranty had just expired along with my drive. The drive would start to spin up and then a relay would click in and spin it down. As usual with this kind of failure, it came at the most inappropriate time. My wife had just put the final edits on several long papers earlier in the day and I was planning to do a backup after she printed them out. So now I'm stuck with a dead SH204 that the repair shop says they might be able to save, the repair bill that follows, and a frantic wife.

Regardless of whether I get the data off the SH204 or not, I'm getting rid of it and buying a Supra 20MB drive. At least it is smaller and quieter. Hopefully, it will be more reliable. I still like my ST, I just don't have any faith in Atari hard disks anymore.

3710. Re: transputer

Newsgroup: comp.sys.atari.st

[]

The transputer is built to support, right in the _microcode_, multiple processes per CPU, and interprocess communication both inside the same CPU and between neighboring CPUs. The _hardware_ takes care of time-slicing between low-priority (user) processes, synchronizing communicating processes, preempting low-priority processes for high-priority wake-ups (e.g. a message sent to a system process), etc. And all with _very_ low overhead.

I agree that limiting the number of concurrent processes to the number of CPUs (currently low, say 4 for a starter machine --- wish I had such a starter now...) is not a viable solution. And I agree that an MMU would be nice. BUT: many people multitask on one lousy 68000 (e.g., Amiga (shish!) or even the ST w/RTX). The main problem, as I see it, is that if one process, say the program you are developing, bombs, the whole system goes down. That's where 4 transputers w/1Meg each are good enough: 1 for you DA's, one for your compiler system, 1 for your background uploads, and still one left for your crash-prone experimental program. If the latter crashes, you reboot just that one transputer.

Helios is NOT Unix. Unix is NOT designed for a multiprocessor personal machine, either. To quote a Helios document (by N.H. Garnett, Perihelion Software):

"That the transputer is in need of an operating system is self evident... Most existing microprocessor OS's cannot support multi-processor hardware, even where they support multi-tasking. Unix is too large, its model of processes does not correspond to that of the transputer, and it remains essentially a uni-processor OS..."

Helios is supposed to be a general OS for a network of transputers, not just for the ABAQ. Whether they did a good job of it, and whether it will take off, I have no idea. I wish somebody else was marketing it rather than uncle Jack...

The utility IBMFMT, which formats MS-DOS disks on the ST, in its later version (1.1?), does overwrite the critical 3 bytes with a random serial number. MS-DOS does not seem to mind, and it's safer on the ST side. (I have no idea what DCFORMAT does.) The ST doesn't mind 3-sector FATs either.

As much as I love to rant and rave about Atari's poor QC and complete/total
lack of support (not to mention vaporware), you really can't blame this
one on them. I too had an SH204 die (although after a year, not 90
days), but you have to remember that for the hard disk, Atari just
buys someone elses and sticks it in their case. The only thing they
really make is the DMA line interface.

Just out of curiousity, my SH204 had an NEC drive in it. What did yours?
Since we know Atari didn't single source it...

> these are the correct values for the parameters). It is now (nearly) as fast
> as a builtin function!
>
> There are however a few problems (and I have not solved all of them):

One of the problems is that GEMDOS will release all of the memory
allocated to program, including that gotten in the original
load/Mshrink process, when the program exits via Pterm or Pterm0. I
don't know if the Pexec(,4,,,) call re-allocates that memory or not.

You might want to experiment by loading a program, then finding the
size of memory in the parent program. Exec the program, then again
find the size of memory in the parent. If it goes up, DOS has freed
the memory consumed by the child program.

You might also want to make the child program find the free memory
size and print it, too. If it goes up after the first exec, down
during the second exec, and up after the second exec (get that?),
the DOS is re-allocating the memory when you do Pexec(,4,,,).

BTW, you find the "free memory size" is Malloc(-1L). It returns a
(long) size of memory in bytes.

3714. Re: laser printers on ST - query for experience

Newsgroup: comp.sys.atari.st
Date: 1988-05-04 15:47:23 UTC
From: roydant@hpgrla.HP.COM
Message-ID: <4110007@hpgrla.HP.COM>
Source record: 252515

I have just recently purchased a HP DeskJet and like it alot. I have responded to another note in this group about a connection problem. I personally have had no problem using it at all. We have Laserjet's (all variations) at work here and the only difference's I have seen is the speed that it takes to get the output. Another rumour about DeskJet is that it won't print text and graphics on the same line, however I have not tried yet. My present system is a 1040 with Magic Sac, Translator , both types of Atari monitors, Supra ACSI to SCSI interface card, two HP 97054B SCSI interface cards, four HP 97501 20 megabyte hard disks, 2400 Baud US robotics modem and the DeskJet on the parallel interface. I have printed from the desktop as well as from WordPerfect Version 4.1 . The printer driver I use for WordPerfect is the LaserJet driver. I plan on contacting WordPerfect corp. for a Deskjet driver or asking Vancouver division here at HP to get one for the ST.

If you have your heart set on a postscript printer you can convert a Laserjet to a postscript printer with a card QMS makes, however QMS also makes the companion card that plugs into a IBM pc backplane so how complete this conversion I am not sure. If you are interested alot drop me a line and I will send out the info.

As stated before in previous note I will be testing out this printer more as time goes along and will post any problems along with solutions (if I have any). If you are having problems you can try me but since I don't work at the Division that makes DeskJet I can't resolve all issues concerning the DeskJet.

Addressing an earlier comment on the interfaces available on the printer, it does have both serial and Centronics parallel built in. By the way you can't use both at the same time though.

> AT&T that's who.

Oops! I forgot that one, but I was still right about DEC not selling
an OS called "UNIX." If you will check, the System V for VAXen is
called "Holmdel 32V" or something like that. The PDP-11 version of
Unix that DEC sells is called V7M11. Only AT&T gets to call Unix
"Unix." The system I am typing this on right now is called "Microport
System V/AT." No "Unix" in the name anywhere!

First a clarification, the character sets are the same for ALL ST computers,
what is different is: the characters you can produce via the keyboard (and
the key combinations used).

In article <11124@prls.UUCP> gert@prls.UUCP (Gert Slavenburg) writes:
>I compared the UK ROM's dated 851120 to my USA ROM's (when living in
>Europe in 1986). The only differences where minor (tables, not routines)
>and are listed below.
*

This can only be true for keyboards that do not have to generate some 7-bit
ASCII charcters via <Alternate> + <Key> (this is the case with all languages
that have a lot of none ASCII characters, example: German), there is special
code in the ROM's which hardwires these keys! On the german keyboard I have
to press <Alternate> + <a Umlaut> to get ']', there is absolutley NO way
to override this short of writing your own keyboard interrupt handler.

(This also explains why some programs that are quite useful in the US, are
absolutly hopeless on a lot of european machines)

*(The english keyboard has got one more key than the US one, so they don't
need the <Alternate> trick to produce the single character that's different
(the pound sign), matter of fact I'm typing this on a real UK ST.....)

Sorry to break the bad news to you, but Dos to Dos is *NOT* Public Doamin
or even ShareWare. It is a commercial (copyrighted) product.

I have used it several times and it will work well for this application
as you have described.

3718. Why'd ya buy the ST? (was Re: Arcade games on the ST)

Newsgroup: comp.sys.atari.st
Date: 1988-05-04 16:43:53 UTC
From: rjung@castor.usc.edu
Message-ID: <852@nunki.usc.edu>
Source record: 252519

(Okay! An opportunity to stop this rash of negativism on the net!)

The question was raised, out of curiousity, of what reasoning did we net.atari.people used to buy an ST. Being one ever willing to chime in my three bits, I'll write:

About a year and a half ago, I began running into walls with my 800XL system. Not that anything was WRONG, mind you, but things such as memory limitations (especially for word processing) and the overall slowdown of new software (yes, even games B-) was getting a bit noticeable. Being the skinflint that I am, I bit the bullet and decided it was time to upgrade.

Like most people, the choice boiled down to the Atari ST vs. the Amiga (please, black & white Macs don't cut it). I was considering the Amiga for a while, but when I compared the cost of the 1040ST and what it offered, along with the Amiga's price and what it offered ("okay, so I don't get 4096 colors, but the ST costs less, comes with a megabyte of RAM, and is COMPLETE..."), the decision was clear.

And to tell the truth, I haven't regretted my decision yet. I still haven't found a TOS bug that was cause for *major* concern (What underscore bug?), and the quality products that have come out for the ST are truly first rate (Three cheers for Antic!).

Admittedly, Atari Corp.'s management has been a tad lackluster lately, but what HAS come out is good. And hopefully, from some of the signs on the net, Atari will be improving itself, and maybe soon we can call "flames" (such as those by Mr. Beckmeyer) a faint memory.

If you're still reading this, thanks for sticking around through this ramble. It's 9:30am, and my biorhythm gets verbose this time of the year...

>out that take advantage of this, but I don't know how "protected" it would
>be.

The Virtual 8086 Mode of the '386 allows programs to run as though they were running native on an 8086. The 1 meg address space of the 8086 can be mapped thru the '386 MMU to any space in memory (and paged in and out) and the I/O calls are trapped so that the supervising OS (a so called Hypervisor) can take the appropriate action. Entire sections of memory such as the video display ram area, can be protected to cause traps so that writing directly to the bits can be emulated. Strangely enough because it takes longer to emulate video after the trap than it does to emulate the BIOS call, programs that *don't* write directly to the video ram run faster than those that do. (Sort of poetic justice I guess). Sun uses this mode on the Sun 386i workstation to run DOS programs under UNIX.

On a completely different note, at the Amiga developers conference Commodore showed a Transputer board that could be plugged into the 2000. This was only a 'technology' demonstration and I don't think they could make it into a product in less than a 18 months maybe longer. They also gave out copies of the 1.3 OS in ROM so that developers could upgrade their machines. All in all and interesting time..

3720. Re: Turbodos and the ideal disk cache

Newsgroup: comp.sys.atari.st
Date: 1988-05-04 17:51:33 UTC
From: apratt@atari.UUCP
Message-ID: <1052@atari.UUCP>
Source record: 252521

From article <307@zinn.MV.COM>, by mem@zinn.MV.COM (Mark E. Mallett):
> well, there's another answer somewhere between write-through and write-back
> cache, and that is the idea of having some control over when updates are
> posted to disk.
>
> [Important stuff deleted; go read the original article if you care.]

Please! GEMDOS is not so foolish as to write to the disk every time a cluster is added to a file. Buffers in the cache are ALWAYS tagged in the "mark as dirty" mode when written to. Then, if the operation doing the writing wants it updated immediately, it says so.

However, GEMDOS always flushes its whole cache when you close a file. This is to update the FATs, directory, and any data sectors in the cache. Also, when you do most directory operations (rename, create, delete) the directory sector is written immediately.

This introduces inefficiency when you are (for example) deleting a bunch of files. Rather than write the FAT and directory sectors after each delete, a delayed-write cache could do the whole sequence of deletes in RAM, and write them only once. The trouble, as I mentioned in my original posting, is that you can't tell when a series of deletes is finished.

Delayed writes are hazardous to your disks, and especially to your floppies.

Can anybody tell me categorically that TurboDOS does or does not delay writes? For instance, can you give me a recipie for demonstrating and reproducing the delayed-write phenomenon?

Wrong.. Read on...

In article <5112@umn-cs.cs.umn.edu> davidli@umn-cs.UUCP (Dave Meile) writes:
>Not exactly true. You *can* run the Translator One box without
>a Magic Sac.

True...

>There is at least one shareware program on the program disk that
>comes with the Translator One which allows you to transfer files
>from Macintosh to GEM format.

Nope Dave, you have it reversed. The demo of the shareware
program that comes with the Translator-One (and the Magic-Sac)
for transfering files will take a Macbinary file on a TOS disk
and correctly place it onto a Magic-Sac disk or (if you have the
Translator-One) a Macintosh disk. This allows a person to
download Macintosh files using his/her favorite ST terminal
program and then run them using the "Sac".

>(I think the author asks for $ to register and get the "full
>function" program that allows transfers from GEM to Macintosh.)

The upgrade you get when you pay for the "full" version of the
program will take files from the Mac side and transfer them to
an ST format disk.

Subject: Re: GIF/IFF Picture formats

In article <39602G15@PSUVM>, G15@PSUVM.BITNET (John F. Gbruoski) writes:
> Are there any PD programs capable of displaying (or converting to
> Degas, Neo, etc) pictures in IFF or GIF format? I'm more interested in
> GIF than in IFF (note: I don't have access to Compuserve.).

There is a program called GIFSHOW which does a reasonable
job. If you have the BARREL brogram by Moshe Braner, you could
then capture a copy of the screen and save it to disk in Degas
format.

In <203@obie.UUCP>, wes@obie.UUCP (Barnacle Wes) writes:
>Have you looked at TIFF (Tag Image File Format) yet? It is becoming

From: wolf@csclea.ncsu.edu
Message-ID: <1786@ncsuvx.ncsu.edu>
Source record: 252526

In a previous posting on the subject, someone mentioned an updated version of Star Raiders for the ST. Does this version work in monochrome?

My reason for posting this message is to express my amusement: Here we have Atari Corp. who has marketed a single computer for which a software developer has to develop TWO distinct versions of a game if he/she wishes to have them run on both colour AND monochrome. But does Atari set a good example by doing exactly that with its arcade-style games? Apparantly not. The first version of Star Raiders at least did not run in monochrome. Atari apparently expects other developers to go through the extra trouble but doesn't do so itself.

The only publisher of Atari ST games to have undergone that "extra effort" (as far as I know) seems to be RainBird/Firebird. Their "StarGlider", "Tracker", etc. games all work fine in monochrome. Since I only own a mono chrome system, I would like to commend them for their efforts (btw, I have no affiliation with this publisher -- I'm just a satisfied user.)

Maybe in the future we will see other companies taking that extra step in developing their games? Perhaps they already do in Europe? (since there, monochrome systems are much more common than in the US)

3726. Re: Bomb list

Newsgroup: comp.sys.atari.st
Date: 1988-05-04 22:58:40 UTC
From: weaver@tut.cis.ohio-state.edu
Message-ID: <12463@tut.cis.ohio-state.edu>
Source record: 252527

Here is a question I don't think I have ever heard hashed around
on here before. Is there a way to intercept the 'bombs' that come onto
the screen with some sort of dialog like on the Mac: "Sorry,
a system error has occureed [Restart|Resume]" or on the Amiga: "System
Error: Guru Meditiation xxx:xxxxxxx [Continue]" so that one can better
diagnose problems with one's own (or someone else's) program? It seems
to me that having a number of non-descript cherry bombs (or mushroom clouds,
which I am told appeared on earlier STs) is not a very good way of represent-
ing an error, but I guess that's just me.

On a similar note, has anyone purchased and/or received the
"NeoDesk" program that was announced in this group last week? It
sounds as if it promises a lot, (but at what return?) I'd be interested
in whether or not this would be a 'wise' purchase.

Yes, its easy to boot from the hard drive. You need to use the SUPUTL.PRG and choose ENABLE when in the boot enable part.

Call Supra tech support at (503) 967-9081 or write Supra Corporation, 1133 Commercial Way, Albany, OR 97321. They can get you a manual and the software to run the drive utilities. I don't know if you will have to pay for it or not (depends on how you got the drive).

>a) How fast does it run? I've seen one software-only Mac emulator (it
> was apparently illegal) that was very slow. The mouse would jump all
> over the place because it couldn't keep up with its speed. I'm
> assuming that the Magic Sac is a more professional system than this
> hack. Is the mouse movement just as smooth as on an ST?

It runs at full Mac speed. (Actualy, that's not totaly true,
it's faster than a Mac on many things. :-)

>b) How well does the Translator work? And how good is the disk
> performance compared to a real Mac and compared to the normal ST?

The Translator-One works fine. With it, I can boot directly
from a Macintosh 3.5" floppy disk.

The one drawback is that when reading/writing a Mac format disk
the access speed is noticably slower than a Mac. This won't be
problem if you copy your Mac files/programs to a "Magic-Sac format"
disk (which will then read/write faster than a Mac)...

Reading/writing with a hard disk using the Sac is very fast. The
single problem I know of is that it's so fast you may have problems
when you go to using a normal Mac hard disk. (You'll find yourself
wanting to toss the Mac hard disk in the garbage...)

>c) Does Turbo Pascal run on it without problems?

Tell you what, send me a legal copy and I'll let you know.. :)

>d) Does the larger screen resolution affect programs poorly? (I know some
> programs [including the Mac desktop] can take advantage of the larger
> screen but how many other programs choke on it?)

Most programs on the Mac play by the rules. (This means they
use the Quickdraw routines to access the screen.) 99% of the Mac
programs I've tried to run on the Magic-Sac work just fine with
the expanded screen. Most exceptions will still run and be

useable, they only have the disadvantage that they won't make
use of the extra space.

>e) How expensive are Magic Sac upgrades? I've heard good things about
> how fast David Small gets bugs fixed and adds new improvements, so
> how much will it cost me to get the newer versions once I have bought
> the current one?

The price of a call to GEnie or Compuserve. I imagine you
could force a few $$ into the hands of the people at dP to get
them to send out a disk, but you can download the newest version
(or get it from a friend) free... This is because you need the
Magic-Sac cartridge to legaly run the Magic-Sac program.

--- Warning, personal-comment ---

All praise directed to Dave Small and his crew is well deserved.
The speed with which Dave has fixed bugs, sometimes within hours of
the bug report, is nothing less than fantastic. dP's policy allowing
free distribution of updates to the program (to registered owners of
Magic-Sac) is a wonderfuly refreshing attitude. Since it's only
legal to use the Magic-Sac program with a Magic-Sac cartridge, they
post the updates on national systems.

--- end of personal comments --- :)

>f) Is there a very reliable dealer of the Sac + Mac ROMs?

Who's your most reliable dealer of ST realated stuff? Go to that
person and force $$ into their hand. If you don't have a local ST
dealer, I could probably put you in touch with one of the dealers in
my area who carry the Sac.

You can often get the roms from the same dealer you buy the Sac
from. If not, you can go to your nearest Apple dealer and get the
roms from there for $30-$50.

>g) Does Mr. Small have plans of eventually getting the Sac to work
> with the latest ROM release? (Isn't that the SE version?)

He wants to, but it's not going to be soon. If he does decide to
do it, It will require almost as much work as it took to develop the
current version. Needless to say, this means LOTS and LOTS of work...

>Thanks to everyone who responds!

Glad to help...

by landay@cory.Berkeley.EDU (James A. Landay):

> It has already been discussed what a problem it would be to get a
> 68020 working in the ST. Now that Motorola has announced a 16MHz version
> of the 68000 (for less than $40 in quantity of ~400) I was wondering
> what it would take to get one of these working in place of the 68000.
> (Alan?)

It's not easy. The ST runs with a synchronous 8MHz bus, even though the
68000 doesn't have to. This is because we interleave video RAM fetches
with the processor instruction/data fetches. Since 16MHz is (obviously)
exactly twice 8MHz, it might be pretty straightforward, but then it
might not, and in any case it is debatable if this will yield
substantial speed improvements.

The '386 UNIX DOS products actually provide a "virtual machine" environment,
where each user that wants to use DOS gets his own virtual PC running DOS.
I think the file layout is just a plain DOS partition; I don't know exactly
how multiple file accesses at the DOS level are handled. And yes, you
CAN run FS or other programs that write directly to screen memory and such
becuase the devices are "emulated".

>running on UN*X systems maybe someone will get an ST version.

We called the XDOS people recently (interested in using it on Sun's).
It appears that they have several programs 'ported' using XDOS and
they were willing to help 'port' programs for us. I got the strong
feelings that there is a lot of binary 'patching' going on in this
porting process. It definitely didn't sound like we could copy
something like flight simulator over to the Sun and run it after some
magical (i.e. automatic) transform by XDOS...of course, I am using
flight simulator as an example, since we wouldn't think of wasting
time playing games on an expensive Sun :-).

Neither Antic nor Atari nor anyone else is going to genlock the ST unless
Atari engineering reworks the glue chip. There have been several different
versions of the GLUE chip around and the very first rev. was able to be
genlocked, but that version has not been made in over 2 years. The only
way to genlock it now is with a frame synchronizer (read $5,000). It
appears that Atari does not plan to make the ST genlockable. Maybe
in the "new" machine it will be able to be genlocked "easily".

I have spent many an hour hacking 2 ST's to get them to genlock
and I DID genlock the oldest one. It was impossible to genlock anything
newer (higher rev number on the GLUE chip) than that though. I even
bought 2 new glue chips to verify it. The display is impressive if
everything is brought into the ST and is timed properly. As I recall
the main crystal had to be changed along with the addition of a loose
PLL circuit so that the crystal oscillator would be a multiple of
Horizontal Sync and then some additional work had to be done
to the 3.58 circuit so that you could drive 3.58 into the ST to obtain
color lock. There were a few other things that i seem to have
forgotten, but they must be trivial. The biggest hassle was to get
the "correct" master oscillator crystal cut. I had to call a crystal
house and had to have them cut the crystal for me.

If anyone needs any additional information, let me know.

3736. Problems running TURTLE and TurboDOS on a Mega 4

Newsgroup: comp.sys.atari.st
Date: 1988-05-05 11:03:17 UTC
From: VBRANDT@DBNUAMA1.BITNET
Message-ID: <8805051100.AA23390@ucbvax.Berkeley.EDU>
Source record: 252536

I've just bought a Mega ST4 (including blitter), and now I'm having trouble running Turtle. It always crashes after displaying the "work" screen (the one saying "Drive A: ... disk needed ... etc."), displaying a varying number of 3 - 5 (!) bombs. Now I can't back up my hard disk :-(

What is the newest version of Turtle ? Has anyone sucessfully used this program with 4 MB ?

Also, I seem not to be able to use TurboDOS at all. The instructions just say "stick it into your AUTO folder". This I've done, in a number of combinations. I have an SH204 and use HDB (by Konrad Hahn). When I boot from the hard disk without any programs in the AUTO folder, the system enters an endless cycle of reboots. Using FOLDER100 (I have ~ 90 folders on partitions C: and D:) fixed this. When I then added TURBODOS.PRG (both before and after FOLDER100), the system booted normally, but after a few minutes of work with Gulaam, empty directories and directories containing garbage began to appear. At this point, a statement like "ls" or "cd" resulted in a return to the desktop, bombs and a "frozen" system.

I suspect a problem with 4 MB, but I don't really know. Has anyone been able to use TurboDOS with 4 MB ?

There are a number of programs that don't work correctly with 4 MB, but they're not interesting. The only real problem was ETERNAL, which doesn't work due to a hardware incompatibility of the Megas. I was able to fix that easily.

Any and all help is most welcome.

>
[some stuff deleted]

The developers kit that I bought back in early '86 even had
a letter enclosed urging developers to write resolution independent
software.

When Star Raiders became available I ordered it without checking
to make sure it ran on a monochrome system, and was very dissapointed
when it arrived and I couldn`t use it.

Anyway, I have both monitors now, so hopefully I have all the
bases covered! :-)

3738. Creating 32 MB hard disk partitions ?

Newsgroup: comp.sys.atari.st
Date: 1988-05-05 13:05:40 UTC
From: VBRANDT@DBNUAMA1.BITNET
Message-ID: <8805051303.AA25402@ucbvax.Berkeley.EDU>
Source record: 252538

I have heard that in the new "blitter" TOS roms, a bug has been fixed that limited the maximum size of any single hard disk partition to 16 MB. Now, partitions of up to 32 MB in size are possible.

While looking at the WINCAP file provided on the hard disk driver disk, I noticed that there is an entry for the maximum partition size in sectors which amounts to 16 MB (and is marked "*** don't change ***").

Am I correct in thinking that I would only need to double this value and then be able to create a 32 MB partition using the HDX partitioning option ?

Has anyone done this ?

- this may fail if "conterm" is set so that the kbdshift info is in the top
byte of the top word. Better use:
if (((*(int *)(iop->ibuf + i)) & 0xFF00FF) == CONTROLC)
^^^^^^^^^^
> a) Lattice has int == 4 bytes, short == 2 (Megamax I thought int == 2).
> So you should replace the *(int *) by *(long *), and the short by int.

- yup, in Megamax (and Laser) int==16 bits, long==32 bits. Avoid shorts.
(I _think_ they're 8 bits in old Megamax, 16 in Laser.)
Better to write code like this:

#define WORD int /* this is for megamax */
...
... WORD ... /* all through the code where it matters */

(Makes it a lot easier to port to another compiler.)

>I hope this helps and is raw enough? Have a nice byte (%-) !

>
>I love these kinds of comments. It seems like I've been seeing them
>about ST related stuff for as long as I can remember. "No it doesn't
>exist yet. But it only costs $39.95".

Well, David may actually be right there. The newest story is:

Due to some design problem with the first batch of the Supercharger PCBs,
availability is now "somewhere around" 3rd quarter 88. And due to the increased
RAM chip prices (thanks, Ronnie, for screwing us Europeans yet again), the
price calculation is now "somewhere around" DM 800.- and not DM 698.- as
advertised originally.

I have seen a number of advertisements in German computer magazines at prices
varying from 648.- to 698.-, but I do not know anyone who has bought one, and
I do not know a single store where you could buy one.

The dealer terms for this "Supercharger" product are among the worst I've ever
seen ...

If this is all old news to you: sorry. Atari-Digests take their time while
travelling through netland.

> like to see Atari (arcade games division) get together with Atari
> (computer division) and program some of their arcade games for the ST.

Atari Games is a subsidiary of Warner Communications. Atari Corp is a computer company, sold by Warner to the Tramiels several years ago. The two companies, therefore, are totally distinct (they do not have the same corporate parent, in fact, Atari Corp is public), and neither really cares what the other does.

> I have played two fairly new games in the arcade by Atari, and they are
> excellent. They are Roadblasters, and Blasteroids.

Roadblaster (singular, I believe) is indeed excellent, but then, the quality of the average Atari coin-op is very high. Witness 720, Rolling Thunder, I Robot, Dragon Spirit, Gauntlet and Gauntlet II, Major Havoc, APB, et. al.

3743. Turbo-C availability

Newsgroup: comp.sys.atari.st
Date: 1988-05-05 16:24:10 UTC
From: rob@hhb.UUCP
Message-ID: <957@hhb.UUCP>
Source record: 252543

[This space intentionally not blank.]

Here is another article I translated from the May 88 issue of the German computer magazine c't. I thought it would be of interest to all of you talking about Borland products.

'Turbo': in the PC world a by-word for a fast, efficient compiler - a foreign word to Atari users.
That shall soon change: for 283 DM Heimsoeth & Borland will finally offer Turbo-C for the ST, complete with assembler and symbolic debugger.
The adaptation to the Atari was done by a Munich-based firm; Heimsoeth would not yield any information about Turbo-Pascal or Turbo-BASIC.
Turbo-C presents a fully GEM-oriented development environment.
The compile-link time on a hard-disk for a hundred-line program was under ten seconds.
The compiler produces object files in DRI format.
In the demonstrated beta version, the production of 68020, 68030, or 68881 code was available as an option.
The ANSI runtime library is written entirely in assembly and permits a practicable program with a length of less than three kilobytes to be produced.
Libraries for all BIOS, XBIOS, GEM, DOS, VDI, and AES functions permit programs which use the full power of the ST to be created.
Heimsoeth estimates programs can achieve 1470 dhrystones.
Using several HL-benchmarks, we obtained results agreeing almost exactly with those the DRI compiler gave.

From: saj@chinet.UUCP
Message-ID: <5101@chinet.UUCP>
Source record: 252544

I'm also having trouble with dvist32. There is a real possibility that the distribution became corrupted on the way to me, although all the ascii text is readable and the programs load. dvistdl simply returns to the shell without showing anything, while dvistnd says its processing the file, types 'server' and locks up the machine. I'd like to recompile for insurance purposes, but I have Mark Williams C, and the stdio.h differences are pretty substantial. Sure I can guess that _fp should probably be changed to _ff, and suchlike. But just 1 bad guess and the result is garbage. Could someone post the description of the struct FILE in Alcyon C, and the values #define-d for IO_READ and IO_WRITE (if there's a legal problem, don't)? I'm really looking forward to being able to see TeX output the way it was meant to be.

>
> anyone have any experience with hp's deskjet yet?

I recall reading recently (perhaps in this newsgroup) that Atari will
be providing a RAM-resident postscript interpreter for their own laser
printer. While I've heard no claims about performance (anybody out there
care to comment?) this may give you the desired combination of low cost
and high utility.

Apparently, the argument was that Postscript in ROM costs an arm and a leg
to license from ADOBE, but ram-based licenses are quite reasonable. Sound
fishy? Maybe I read an April Fool's joke and didn't notice the date?

Crawley@ALDERAAN.SCRC.SYMBOLICS.COM (Eric S. Crawley) writes:
->Exactly 92 days after purchasing my SH204 hard disk, it failed to spin
->up. Of course, the 90 day Atari warranty had just expired along with
->my drive. The drive would start to spin up and then a relay would click
->in and spin it down.

a very similar thing happened to me...

Gee, a 90 day warranty. how novel! as a "registered developer", i was told
by atari that because i get a "break" on equipment costs (i also buy 3-5
times more equipment than a "typical" user) i get only a 24 hour warranty.
consider yourself lucky. i saved $75-$100 on the initail drive purchase (i
bought 2 SH204 for the 3 1040's and 5 or 6 odd monitors i have) and
after having to pay atari about $250 for a trade-in PLUS cost to ship,
i did not really save ANYTHING, now did i? to top it off, the first replacement
drive was defective as was the SECOND! the third one is still sitting in
a box (i haven't even tried it out...i'm using a borrowed drive which
i know to be reasonably reliable. i can't afford to loose another few
days work).

i wouldn't count on the Supra to be any more reliable than the atari. i know
several people who have had problems with them, also. i have heard that
the astra drives are built "like brick (fill-in-the-blanks)...", being
almost hardened (mil spec)! if they use the same drivr mech and boards,
i can't see how they could be any better, however, unless really packaged
will (cooling, dust, shock mount, etc).

The Desk Jet DOES have both a parallel AND a serial port, so you can use the thing as a serial printer.

If the ST is not delivering enough current (and I kinda doubt that), you can put in a set of non inverting buffers (chips made for interfacing low current to high current devices).

The ports on the ST conform to industry standards, so if the ST can't deliver the current, other machines would have the same problem. I can say, as an ST and Desk Jet owner, I have had NO trouble with either unit. The only problems arise when I don't have a driver with the proper control codes for a particular software package. The ST can't do a screen dump to the Desk Jet as is. But, I hear that you can stick a little program on your boot partition or disk that has the graphics codes for the DJ, so t

hat is not a major problem.

Software support for the Desk Jet will rapidly increase by this summer.
Be patient. Any new machine takes time to get settled into the market.

Rob

3754. re: laser printers on ST - query for experience

Newsgroup: comp.sys.atari.st
Date: 1988-05-05 21:04:14 UTC
From: Robert_Lisowski@rubbs1.UUCP
Message-ID: <33.22816345@rubbs1.UUCP>
Source record: 252453

I can highly recommend the HP Desk Jet. Although it will take a few months for more software support, the printer is useable for text dumps and word processors that have user-configureable printer control codes. Soft Logik will be supporting it in their new Publishing Partner Pro package (which I am getting--when they get around to shipping it). HP says that it can be used with some Laser Jet compatible programs.

The print quality, on good tight paper, is exactly the same as a laser (and I'm quite picky about such things). The speed of printing is about 1/2 to 1/4 of the speed of most lasers, depending on if you use draft or letter quality (draft saves ink and looks almost as good, except a bit lighter).

Any questions--leave me a not here or on echomail atari st.

I agree 100% about ST Minix, but do you really think we need a new group
already? Shouldn't we co-exist with the IBM Minix users for a while so
we can learn from them? There isn't so much traffic in comp.os.minix
that we need separate groups, I don't think. The IBM folks might get a
little jealous of our "large model" compiler though :-). Maybe this
discussion should be repeated in the minix group before doing anything.

Yes. Read on.

> Apparantly not. The first version
>of Star Raiders at least did not run in monochrome. Atari apparently expects
>other developers to go through the extra trouble but doesn't do so itself.

Despite all the Atari flaming ("constructive criticism"?) going on here,
you can't pin this one on them. I don't know about the latest release of
Star Raiders ST, but Atari's _Missile Command_ game not only runs in low
and high resolution, but medium as well. I do believe (but cannot confirm)
that their gun-shooting (mouse-shooting?) game _Crack'ed_ also runs in
monochrome...

>The only publisher of Atari ST games to have undergone that "extra effort"
>(as far as I know) seems to be RainBird/Firebird. Their "StarGlider",
>"Tracker", etc. games all work fine in monochrome. Since I only own a mono

I think the idea would be a 8086 machine language compiler. If you think of
what a C or Modula-2 compiler does then expand that up to a complete
CPU chip language. I don't the data would be that hard to work with if
you had a configuration file for each program to help it compile to 680X0
machine code. Of course you would have to do data flow and global check on
the process to keep things compiling correctly.

I can't think of any EXCEPT Word Perfect right off the bat. Too bad, since postscript is usually quite a bit faster than creating a bit map, as you must do with the HP LJ.

> and the followup, what packages can drive non-postscript lasers, e.g.
> hp laserjet, and cheaper lasers like the kyocera, okidata, etc. what
> about interfacing - any problems with any particular machines?

Here's my setup: at home, I own an ancient (8/85) 520ST, upgraded to 1 meg. I also have an Oki Laserline 6, which is an HP LJ compatible, with 512K memory. At work, I have several Mega-2s (belong to my employer, that is), and the use of an HP LJ II with 4.5 meg of RAM.

I use/have used WordPerfect with the HP, using WPs driver - it works pretty well. I use First Word Plus, using a driver I wrote in about an hour one afternoon for my Oki. It works great, if you have enough fonts to be interesting. The LJ II does not come with an Italics font in it (but the Oki does).

I also use the WordUp word processor and EasyDraw. I have Migraph's HP300.SYS GDOS device driver for the LaserJet. It works well with both EasyDraw and WordUp, but IT IS SLOW AS MOLASSES IN JANUARY!!

The driver has to create the entire page in memory, as a bitmap, and then send it out to the printer a byte at a time. The average time for a page full of text, with 1/2" margins all around, is about 12 mins on the Mega-2.

The Migraph driver has an option for printing on an HP (or clone) with limited memory. I haven't tried this yet, but the docs say it slows it down by a factor or 3 or so. This will make for 35-40 minutes per page.

I haven't seen a GDOS device driver for postscript printers, does
anybody know of one yet? Does anybody want to write one?

> i'm interested in (but don't yet own) wordperfect, softlogik's desktop

If you can get the driver(s) for the LaserWriter, buy it. Postscript
is the way to go, for speed if nothing else.

> anyone have any experience with hp's deskjet yet?

Not me. See other postings (lamentations) here.

> (or I, anyway) would call them...

Agree, but I got (a hint for) the names from Data Becker's Atari ST Intern.
I think with a circular buffer, a reader and a writer it's anyway a question
whose side you're on.

>> for (i = iop->ibufhead; i != iop->ibuftail;) {

> byte of the top word. Better use:
> if (((*(int *)(iop->ibuf + i)) & 0xFF00FF) == CONTROLC)
> ^^^^^^^^^^

Still better maybe:
for (i = iop->ibufhead; i != iop->ibuftail;) {
if (((*(int *)(iop->ibuf + i)) & 0xFF0000) == CONTROLC)
the ascii bindings may be changed by an xbios call, it's safer to use just
the scancode. But thanks for the correction, anyway!

> Better to write code like this:
> #define WORD int /* this is for megamax */
> ... WORD ... /* all through the code where it matters */
> (Makes it a lot easier to port to another compiler.)

or to use:
#include "portab.h"
which just includes such definitions (at least for Lattice there's such a file).

>- Moshe Braner. (YAFIYGI) (You asked for it, you got it.) (TeX)
>(Still looking for a used 520ST system)

I use one. A plus that is (520 ST++ :=)

Leo (C-ing is believing).

3766. Re: how do I print-screen (Alt<help>) on Epson LQ-500/800?

Newsgroup: comp.sys.atari.st
Date: 1988-05-06 11:08:30 UTC
From: leo@philmds.UUCP
Message-ID: <481@philmds.UUCP>
Source record: 252466

In article <4675@batcomputer.tn.cornell.edu> braner@tcgould.tn.cornell.edu (braner) writes:
>In article <476@philmds.UUCP> leo@philmds.UUCP (L.J.M. de Wit) writes:
>> 1) Alter the bios, as follows... (much follows)
>- actually replacing the screen dump routine is rather simple, since there
>is a vector to it (albeit not well publicized). The LONG at the address
>$502 points to the standard routine, called by both the Alt-Help mechanism

So I got curious. Disassembled the relevant parts yesterday, and guess what?
Scrdmp (the XBIOS entry): In VBL:
movea.l $502, a0 tst.w $4ee(a5)
jsr (a0) bne.s no_dump
move.w #-1, $4ee bsr Scrdmp
rts no_dump:

Hey, this guy seems right. But reading a disassembly from D.B.'s book:
Scrdmp (the XBIOS entry): In VBL:
clr.w $4ee tst.w $4ee(a5)
bsr $5a60 bne.s no_dump
move.w #-1, $4ee bsr $5a60
rts no_dump:

The last fragments, which are used in the disk-based TOS versions, are obviously hard-coded. Seems the TOSses are incompatible in this respect. Very likely an old TOS will throw bombs when using $502 (or just completely reset by jumping to address 0); but who wants old TOS, anyway?
Maybe you or others know of other compatibility problems? I would like to registrate these. Use e-mail to send them to me; I will forward them to the net if there is some response (probably the guys at Atari Corp. already have some info?).

>program you can place in the auto folder. You have to do something to avoid
>reentry of the actual dump code if one presses Alt-help while the dump
>is in progress. Also, you should provide for abortion on request or if
>the printer does not respond.

Actually, the VBL itself prevents re-entrance by setting the vertical blank semaphore:
vbl:
addq.l #1, $466 # frclock (increment frames counter)
subq.w #1, $452 # vblsem (decrement vbl semaphore)
bmi.s vbl_ex
...
vbl_ex:
addq.w #1, $452 # vblsem (increment vbl semaphore)
rte

Mostly the skip is not performed; vblsem's value is 1, 0 within the routine.
A screen dump takes a lot of time (many, many VBL's!), so when interrupts come while performing a screen dump, the vbl just skips to vbl_ex (leaving with a value of 0 in vblsem).
You should however test the value in the word at $4ee (Alt-Help pressed) to abort the dump when the key was pressed (for compatibility with the 'standard routine').

>I have actually written such a beast for my printer (an Apple Dot Matrix,
>no kiddin!) (which is really a modified NEC 8023), so if there is much demand
>I can post the source code. Warning: it is in assembly language.
>
>- Moshe Braner

I've got one in C (with a tiny bit of assembly coded in); it does not dump in graphics mode, but scans the screen and tries to interpret pixels as TOS characters. It is much faster than graphic dumps, and useful for programs that generate TOS character output (editors, compiler output, etc.), not for GEM.
It is about 290 lines of code. If you or other people are interested, please e-mail.
(Maybe we can make it a combined posting, Moshe?).

Leo. (C for yourself).

>program with 4 MB ?

The current version, posted in comp.binaries.atari.st recently, is 2.17.

I was meticulous in writing Turtle to do absolutely everything with
standard, supported system calls. I'm rather discouraged to hear of
problems on the ST4. I'll try to locate one here for testing. If there is
a problem with executing in 4 MB, I'll create a fix for it. I have heard
of no problems with local people running on 2 MB Mega systems, though.

3768. Suspected GEMDOS bug or where did the disk sectors go?

Newsgroup: comp.sys.atari.st
Date: 1988-05-06 13:02:20 UTC
From: bdeskin@cognos.uucp
Message-ID: <2936@cognos.UUCP>
Source record: 252468

A week ago I posted a question about what happens to 2K when formatting a floppy disk. That is, formatting a single sided disk gives you 349K whereas the calculation 80 tracks times 9 sectors (720) less 1 boot sector, 2 FATs at 5 sectors each, and a directory of 7 sectors (18) leaves 702 sectors or 351K. I have since been told that this is an old GEMDOS bug where GEMDOS "looses" 2K or 4 sectors. It explains why most RAM disks I have provide 2K less than what's asked for. Can anyone confirm this bug (Atari???) and is it fixed in the new ROMs. Thanks in advance.

For all of you who have been ragging at Atari for its poor support, it is always the same reason, namely the Tramells. Have it ever occured to you that the reason it may not be as good as Apple or others is because that the price of the Atari stuff is too low to provide enough revenues to pay for the kind of support that you want? Remember, this is America, and no one gets away without paying. To qualify this, let's look at some of the big companies. In my professional experience, I have found DEC support to be the best. However, with what we pay in 1 year for this support, we could buy 10 1040 STs. As for IBM, they are a real pain. I once called them to arrange repair of some mainframe terminals, and when I gave them the serial numbers, they said Amoco owned them and insisted I was crazy for saying otherwise. And IBM will always try to sell you a machine that just barely meets your requirements, push a bunch of hoggy software on you, so you need to upgrade in 6 months.
If you want support to be as good as some others, would you be willing to pay what you do to the others?

Now just for the record, I have phoned Atari for some technical support, and of coursethe person wasnt in, and of course they said they'd call back, and of course they didnt. But other times I have gotten through, and they have answered my questions. And that isn't different than most other companies I have dealt with. Lately I have been trying to get through to Fairlight with with the same result, and here is the Mercedes of the electronic musical instruments manufactures.

I am happy with my ST, iuntil I win the lottery it is the best for musical applications. With the Hybrid Arts stuff, I will be able to make CD quality masters at 1/10 the cost of synclavier, and that is cool.

From: apratt@atari.UUCP
Message-ID: <1054@atari.UUCP>
Source record: 252475

Leo@philmds's description of keyboard input on the ST is imaginitive, but totally off the wall. The ST has INTERRUPT-DRIVEN keyboard input: when a character is pending at the keyboard port, the processor is INTERRUPTED (no Vblank). The character is read from the port, and placed in the keyboard input buffer (the one whose address you can get from the Iorec Xbios call). You don't need to use this buffer, however, if you understand the interactions between BIOS and GEMDOS I/O.

The potentially confusing part is that if you do GEMDOS cooked input or output, the BIOS buffer is COMPLETELY EMPTIED into a GEMDOS buffer. So if you follow GEMDOS output with BIOS input you will get "no characters waiting." GEMDOS "cooked" I/O is Cconin, Cnecin, Cconout, Cconws, and Cconrs, and Fread and Fwrite on handles which refer to the console, such as handles 0 and 1 (stdin, stdout), handles DUP'ed from those, or -1, which always refers to the console, even if handles 0 and 1 are redirected.

If you don't want ^C to terminate your program, you can either
(A) use only BIOS calls, or
(B) use only GEMDOS raw calls (Crawcin, Crawio, Cconis), or
(C) use a terminate-vector handler which longjmp's to your recovery code.

The best reason to use the buffer structure returned by the Iorec call is as a quick check for input keys pending. Checking to see if in == out (meaning the buffer is empty) is lots quicker than the equivalent BIOS call. This only works if you use NO GEMDOS console I/O calls. (I haven't forgotten about critical sections: I investigated, and they don't matter here.)

>-bill

I, on the other hand, have a different story. I bought one of the
20 Meg Supra drives, and it's working very well. For a while there, I was
having the strangest problems with it, so I sent it in for repairs. It
turned out to be interference (at least, all they did was shorten the DMA
cable, and it worked), and the person on the phone at Supra was very
helpful about everything. All in all, I'm well pleased.

>[Lots of interesting stuff about the transputer]
>

Thanks for some information about the transputer, I would be most happy if the following points could be cleared up too.

Well if there is an OS, will there be a copy for every processor, will it be in shared (slooow) memory or will there be a processor running os code exclusively passing results to the other transputers. (all of the above methods sound not tooo great to say the least).

Same for shared resources like graphics, I/O and stuff. How ?

I had actually expected that the system would run more like this,
A table with processes that are to be run. Lots of processors (say 4 in the beginning, (- stolen from M.B.-)) grabbing processes that need to be run, swapping in the process space from disk (*) and executing those merrily. If we have 1MB per processor, we don't -quite- have Virtual Memory, but something inbetween, and it sounds quite Unix-like. Arguably it might not be the perfect thing to do for the transputer, neglecting maybe some hardware niceties.

Natuerlich!

Is there a list of the known bugs in TOS/GEM. I am specifically interested in those regarding hard drives.

Namely, recently, writes to my hard drive have become somewhat unreliable. Sometimes characters get scrambled, other times the file turns out to have a zero size.

Is this a known problem or is my hard drive sick?

If it is a known problem, is there a patch for it?

I have a 1040ST with a Supra 20Mb. I've made no modifications to either the Atari or the Supra.

I'm sure a lot of people already know this, but for those that don't.
There are multi-processor hacks of UNIX in development, even by some
pretty major companies. Unix isn't designed for a multi-CPU system
but it has been hacked to run on multi-CPU systems by basically dividing
the kernel up and letting parts run concurrently. Some vendors have
gone with "message passing". I know of at least one company putting
in major efforts to get a multi-CPU version of BSD UNIX to run faster.

3782. Atari ST for sale

Newsgroup: comp.sys.atari.st
Date: 1988-05-06 22:55:00 UTC
From: minow@thundr.dec.com
Message-ID: <8805062000.AA15492@decwrl.dec.com>
Source record: 252484

This is really a reply to Jinfu@cup.portal.com, but mail bounced and the phone number didn't seem to work. In an earlier posting, Jinfu mentioned a friend interested in buying an Atari ST. I have one for sale:

Atari 1040 ST, bought in November 1986, in perfect condition, with
-- monochrome monitor
-- Timesaver battery back up clock.
-- all Atari software (Basic, Logo, 1st Word)
-- one disk with p.d. software (Uniterm, Arc, Kermit, etc.)
-- Flight Simulator
price $750.

Sold seperately:

-- Mark Williams C V3 (on order) (includes source-level debugger). $140. Note: I won't warrant that this is usable without a hard disk. I was using V2 w/o a hard disk for a year without difficulty, and I'll try to set up a satisfactory working environment. Note that a single floppy system is not officially supported by Mark Williams.

-- Supra 30Mb hard disk, bought in October 1987. $800. Includes latest Supra software toolkit and a manual for the disk drive.

-- Panasonic 1080i printer, including cable: $160.

The only Atari motherboard modification was a power supply eco to remove a whine caused by attaching a modem. The modification was made in November 1986.

I'll guarantee that everything is in working order when it arrives at your home. If it's not satisfactory, you return it within a week and I'll refund your money.

Please feel free to phone me (home: (617) 646-2199, work (617) 493-9922) if you want to discuss this further.

>Why can those frustrated ST developers/users sell their STs to recoup
>some money to buy a Mac or Amiga, or PS/2 and stop whinning here? If
>you are not happy with the computer, the best thing to do is go for
>another one and stop crying. Just leave us 'stupid' happy users alone
>will you?

It's easy for you to say. I would love to be able to dump my Atari
hardware to somebody who could use it. But it's not that simple.

I can't, in good conscience, just forget about the 15,000 or so users
we have that need support for ST products. It takes ST hardware to
maintain ST products.

We originally had to pay FULL PRICE for Atari devlelopment hardware
(like $800 for an early SH204 drive!). It wasn't that bad. I knew it
was risky. Just the same, I know Atari could have done more for those
of us that helped launch the machine. We were there back in 1985.
Micro C-Shell sold one hell of a lot of Atari STs in those days!

I've got nothing against anybody out there that likes their ST. I'm
sorry if that message came accross, becuase it's not how I feel. I'm
not frustrated with the public. I'm fed up with Atari Corp.

I was simply letting off steam about what the Atari management has done
(and not done) and unless you've dealt with them, you have no room to talk.
You just couldn't possibly understand what it's like. The worst thing
that's happened to you is that you have to hit 'n' or read about it a
little bit. Oh that's real tough - a few screens of pain and agony.

3786. corrected alternate address for netlib

Newsgroup: comp.sys.atari.st
Date: 1988-05-07 00:28:55 UTC
From: martin@lakesys.UUCP
Message-ID: <646@lakesys.UUCP>
Source record: 252482

It has been brought to my attention that the alternate address for netlib is incorrect due to a typo. The correct alternate address is:

netlib!lakesys.uucp@csd1.mil.wisc.edu

All future copies of the index will have the correct alternate address.

I apologise for any inconvenience which you may have had.

Marty Wiedmeyer
martin@lakesys.UUCP

BTW, the latest additions to netlib are:

---- volume1 ---

calltime.uaa 880506 Log calls to answering machine on the ST
deskpak/part.uaa 880504 Multi-DA. Calculator, appointment book etc.
deskpak/part.uab 880504 Multi-DA. Calculator, appointment book etc.
deskpak/part.uac 880504 Multi-DA. Calculator, appointment book etc.
deskpak/part.uad 880504 Multi-DA. Calculator, appointment book etc.
deskpkdc/part.uaa 880504 DOCs for DeskPak
deskpkdc/part.uab 880504 DOCs for DeskPak
deskpkdc/part.uac 880504 DOCs for DeskPak
gifshw2.uaa 880427 Graphic Interchange Format Display .PRG
memfil14.uaa 880427 Memory, Binary and Sector Editor w/Search v1.4
uw/part.uaa 880502 Unix Windows for the ST
uw/part.uab 880502 Unix Windows for the ST

==========

To request files send a message to netlib@lakesys.UUCP consisting of:

send filename/part.uaa from archives.atari
send filename/part.uab from archives.atari
send filename/part.uac from archives.atari
etc.

If the file is found in one of the new volumes, (the example is volume 1) the syntax is:

send volume1/filename/part.uaa from archives.atari
send volume1/filename/part.uab from archives.atari
send volume1/filename/part.uac from archives.atari
etc.

Note there is no space between the word "volume" and the number of the volume.

Subject for the message is not necessary.

Use the form above to assure that the parts will arrive as separate messages.
Parts are approximately 50k each.

This index can be obtained by sending:

send index from archives.atari

to netlib@lakesys.UUCP

A path which has proven to be successful for some users is:

netlib!lakesys@csd1.milw.wisc.edu

Any comments, problems or suggestions, please mail to martin@lakesys.UUCP.

3787. Re: dvist

Newsgroup: comp.sys.atari.st
Date: 1988-05-07 03:49:11 UTC
From: tyler@stpl.UUCP
Message-ID: <144@stpl.UUCP>
Source record: 252488

W.R.T. your dvist problems here are a couple of questions/hints.

1) Question. I presume that the arc program didn't croak in file extraction
which strongly implies that the distribution arrived OK.

2) Check the dvist.rc file and insure that the default search path is
correct. Don't try to implement the server at this point.

3) Install the fonts into \font subdirectory as per the instructions.
Basically create a subdirectory for each root font type and
then rename the corresponding font file as the size with
pk appended to it. e.g. cmr10.96 would be placed into the
subdirectory \font\cmr10 as the file 96pk. Now try to preview the
dvist.dvi file with the command:

dvist -f\font dvist

This command assumes that you are running under something like
gulam or gemcsh. If not, insure that the program have been renamed
to a .ttp file so that you can provide command arguments. If this
works, then the programs are ok. If not, send email to me and I'll
look into it a bit further.

4) Recompilation? I would try to disable the CLIENT protocol by undefing
the CLIENT flag (I believe set in system.h). Thus you should not have
to play with stdio etc.

Avy and I are always open to help others with our mistakes and
of course to suggestions. Please feel free to email or phone us.

Message-ID: <2918@ihlpe.ATT.COM>
Source record: 252490
Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit

I found the following article in the latest issue of the electronic atari newspaper called Zmagazine. It is attributed to the Computer Shopper though, so credit should go there. Since the Zmagazine is carried on many BBS's and CompuServe, it is public domain, but I am giving proper credit.

BULLETIN BULLETIN BULLETIN BULLETIN BULLETIN BULLETIN

835 27-APR 21:27 General Information
Atarians Rejoice (?)
From: DFSCOTT
To: ALL

This is a Computer Shopper exclusive story.

Atari Corp. is undergoing another corporate restructuring, but this time more massive than before. A division company, to be known as Atari Computers, is being formed. Charles Babbitt has been named Atari Computers President, and Anthony Gould his Vice President for Sales. Although still under the umbrella leadership of the Tramiels, it appears at this time that a semi-autonomous company in the manner of Amiga Corp. is being spun off. In an exclusive interview, Atari chief spokesman Neil Harris told this reporter that Babbitt has been given two months to form a new corporate strategy for Atari Computers. During that period of time, says Harris, Corporate leadership has ordered no one at Atari Computers to speak with the press. Nonetheless, Babbitt was cornered into releasing general information to Computer + Software News about a special packaging arrangement of the Mega 4, perhaps for sales to Value-Added Resellers.

It apparently has yet to be decided what role current Atari Corp. management will play in leading the new Computers division. More details as they become available.

END OF ARTICLE

Since it is not dated April 1, I assume it is for real. If so, it may be the answer to all those that have been Atari bashing lately. I view it as a positive step for Atari and one that could raise their credibility IF they can bring more products to market. I have also read that because of chip problems, etc., Atari will be out of virtually all products by the end of the year. No amount of reorganization will help if you don't have a product to sell.

Crawley@ALDERAAN.SCRC.SYMBOLICS.COM (Eric S. Crawley) writes:
> Exactly 92 days after purchasing my SH204 hard disk, it failed to spin
> up.

This sounds like a problem with the disk itself. You might want to
check and see if the drive manufacturer has a long warranty than Atari
does. Many hard disk manufacturers have 1-year warrantys. If it is a
problem with the disk, the manufacturer will repair it for you if it
is still under warranty.

> Regardless of whether I get the data off the SH204 or not, I'm getting

> just don't have any faith in Atari hard disks anymore.

Funny, I sold my Supra hard disk to buy an Atari SH204, becaus the
Atari was so much quiter. Have you listened to a Supra lately? Supra
makes good products, but don't expect miracles from them, or any other
hardware manufacturer for that matter. If you had gotten the same
drive in a Supra box, it would have failed there, too.

Just out of curiosity, was your SH204 one of the older ones with a
Seagate ST225 disk in it?

[questionable head info deleted]
>
>He recommends Sony SS disks,

I do too. I have over 400 disks formatted double-sided. Over
90% of them are Sony single-sided. Out of all the SS formatted
as DS, only 4 of the Sonys have failed on me. I've tried this
with other brands and generics (many that are suppost to be
"made by Sony"), but with significantly higher failure rates on
all of them.

(Disclaimer: This info only covers using 3.5" disks with an
Atari ST. I have very little knowledge as to how well this would
work on a Mac or any other machine...)

What follows is somewhat long and technical in nature...

Well, I hacked up something in 'C' on my Amiga, similar to what you're attempting. I didn't like my machine going down on things like divide by zero, opcode A emulation, and things like that. So, I wrote a little (actually not that little) that runs in the background to catch cpu traps like those mentioned above. I don't know if you'll be able to do it, since you don't have a multitasking environment. Maybe a desk top accessory?

I'm not too familiar with the ST, so I can tell you what I did on my Amiga as generically as possible, and maybe you can go from there. This discussion presumes some knowledge of 68000 assembly and 'C'.

O.k. What I did was get a list of the 68000 trap vectors, and I reset them to point to my code. It went something like this:

```
void (*ptr()); /*For a pointer to a function that returns void.
I actually just used an unsigned long*/

void MyTrapCode()

{

/*Stuff. See below*/
}

main()
{
ptr = 0000014; /*Some thing like this for divide by zero.
I don't have my source in front of me right
```

```
now!*/
*ptr = &MyTrapCode;

}
```

Voila! Now any program that would divide by zero executed my function! Unfortunately, where you want to go from there can get very tricky indeed. For me, I didn't want the machine to pop up a task failed requester and crash.
Do accomplish that, (This is greatly simplified, but communicates the essence of what I did), MyTrapCode() looked like:

```
void MyTrapCode()
{
#asm /*This will differ for your compiler!*/
move -(sp),d2/d4
unlk a5;
#endasm
/*The above lines undo the default startup code for a function*/
#asm
/*Here's where I removed all the things pushed onto the stack
because of a trap*/
#endasm
Wait(-1); /*Stupid, but effective. Task was held until
I pressed ctrl-c in it's window*/
}
```

I know this was kind of general, but if you use your imagination, I think you can take it from there. You can learn alot about your compiler and machine in so doing. There are alot of subtelties to watch out for, some I didn't really discuss. So, be careful, and happy hacking!
Well, I hope this helps. If you have any specific questions, I'd be glad to try and help you out. Just send me mail...

Paul Cisek of Spectral Fantasies is just finishing his AD&D character generator for the Atari ST. This program will be ShareWare and I will probably be posting it on comp.binaries.atari.st in two to three weeks.

The AD&D Character Generator covers all the rules in the AD&D game spanning all the rule books including the Survival Guides. Every aspect of the character is covered. The program features full use of GEM, a full 3+ page character sheet printout, library functions, and is the first in a series of compatible DM assistant programs. It is written in Lazer C and will run on any Atari ST. (An Amiga version written by Tom Mikalsen will also be available soon.)

That Atari Corp. is spinning off a Computers division should be very good; as long as they get money from Corp. At last, there will be an organization that will deal with Computers. Not games, calculators, or suits against chipmakers. Maybe there's the slightest chance that Atari will start acting like a real computer company.

Here is my wish list:

1. More updates to GEM. It's the ST's _OS_ for chrissakes, everyone :-) has to use it so it better get fixed and enhanced.
2. More support for developers. Face it, Atari has no respect so it might as well be nice to the people who can keep the machines alive.
3. Buy an IC factory (unless this has already been done). and get the blitters out. THEN get the roms for the new GEM out. And on the latest TOS; send it to stores to be distributed by them. Have the retailers copy the disks for them. It would get customers for the retailers and get the revisions out.
4. For the 8-bitters. The next batch of OS roms should have the Newell Fastchip routines built in. Buy rights to put out the Newell code and maybe Newell will make a profit. I see his Fastchip going for $15 every-where. I don't see how he can be making anything, considering the size of the 8-bit market.
5. Again, 8-bitters. Sell Flight Simulator 2 on cart, maybe someone will buy a FSII that does no disk access! Indicate on the XEGS packs which machines a given cart will run on. (and accurately)
6. More user support and service.
7. Give the computers better names (from now on, it's too late for the st and xe). The computer is be an extension of the HUMAN mind. A computer should have a short (4 syllables or less) name that has a minimum of "whiny" sounds (ee,aye).
Here are some bad names and why I think I hate them:
ecks-ee too whiny, and it sounds like a sports car
ess-tee ditto
a-mee-ga whiny. reminds me of amoeba and Velveeta.
ps/2 says nothing, in other words, very IBM personality wise
Microsoft sheesh. not only is it small, it's soft. feminists may protest, but a weak phallic association turns everyone off. Note: I am not advocating "LargeHard" as an alternative:-> Imposing names are also bad.

Generally, these names do not sound good in conversation.
These do:
Macintosh canadian/scotch sounding. not wimpy (the machine may be though)

Dr. Halo luminescent sounding.
Dell (as in Dell computers) just good sounding
Grid one of the best Hi-teck sounding names.
etc.
And pertaining to the topic is the choice of numbers, i.e. 1040ST, Apple2.
obviously, XF551 is vastly worse than 1040 or 520. But 1040 is not as
1 or 2. I know very little about this, but I guess that the "best" numbers:
have no suffix like hundres or billion, can be said with few words as in
ten-forty or fifty-five, or have repetitive digits if they are long as in
six-two-six three-twenty-three, or are single digits. There should also
not be too may different models for one name. Imagine mega 2,4,6,8,10,11,14.

I realize that some people believe the name of a product has little to do
with it's desirability, and back when micros were bought by hobbyists this
was true, but now, we are dealing with "normal" people who don't have a
hacker's appreciation for programmability, instruction sets, and power
requirements. It's going to be a mass market, and that demands mass market
measures. Now, computer companies must hire logo, case, and graphics
designers as well as engineers. This is inevitable, even for a cost-cutting
outfit like Atari. Promotion and design are as much a part of business
as is manufaturing.
I am not advocating that Atari change the name of the ST and XE, they
already have name recognition, but they should not name the next product
the TT or EST or A?AQ (or promiseLAN, that's plain stupid). How about
names like: The Roadway, the Michael, the David (as in D&Goliath for all
the Bible nuts out there :-), the Stone (for go players), the Audrey.

The gate array will also emulate most registers of the 80XX hardware of
a PC.
Still there are just prototypes; there is no stable working version so
far; this is coming "real soon now".

Hmm, I do not like the idea of this thing. It has no slots.
Ok, it will run MS DOS 3.2 and clean DOS programs, it will not support
new hard/software (VGA OS/2). This is coming "real soon now" as the AT
(80286) version.
Hmm.

>(should?) give you a bus error or address error. This could, of
>course, be changed by replacing the MMU chip.

No. You don't need to do that.
The GLUE chip monitors -AS (adress strobe of the 68000). After a memory
cycle the 68k waits for DTACK or VPA; if neithe comes, no new cycle
starts, so there is no new AS. A simple monoflop, retriggered by AS,
will interrupt the wait by saying "BUSERR" to her majesty.

If you generate your own DTACK on your RAM board, you can easyly expand
memory beyond 4 Meg.
I did it; I added 2 Meg of DRAM (as resetproof Ramdisk) and 256 KByte
battery backed SRAM (for fast booting) by decoding the full adress bus.

From: gordan@maccs.UUCP
Message-ID: <1179@maccs.UUCP>
Source record: 252499

In article <5101@chinet.UUCP> saj@chinet.UUCP (Stephen Jacobs) writes:
-
-I'm also having trouble with dvist32. There is a real possibility that the
-distribution became corrupted on the way to me, although all the ascii text
-is readable and the programs load. dvistdl simply returns to the shell
-without showing anything, while dvistnd says its processing the file, types
-'server' and locks up the machine.

I had the same problem. Check the DVIST.RC file -- as distributed, it
specifies a path of D:\FONTS for the font files. If you don't have a D:
disk, this simply hangs forever with no error message. Simple to fix:
just change DVIST.RC to contain A:\FONTS (or whereever you happen to
have installed them).

Also, don't forget to set up subdirectories properly for the font files,
e.g.
FOOBAR.96 -> \FONTS\FOOBAR.96PK

By the way, DVIST _is_ usable on a color monitor if you use a monochrome
emulator (e.g. MONOWARE.PRG, which came over the net a while ago). Best
to use a speed of 10 with MONOWARE (slowest screen refreshes, but least
amount of CPU cycle stealing).

I think the real advantage to compiling the programs rather than interpreting
them like pc-ditto is that you can apply optimizing techniques. I think that
xdos looks ahead and computes only those flags which will actually be used.
An interpreter must compute all the flags although most are ignored.

>FTL are among the best Atari ST developers around. Long may they live!

While I agree in general, I don't think bringing up FTL in a
discussion about the problems involved in color-ONLY programs is
a good idea. While Dungeon-Master is one of the best games on
the ST, it's so color-only that even OmniRes can't get it to run
on a monochrome monitor.

> You could also check out that new program _Monoware_, which is
>supposed to make your monochrome monitor emulate a color monitor
>perfectly, and vice versa. I haven't used it myself, but
>everything I've heard says that it delivers.

You've got it backwards... Monoware runs monochrome programs
on a color system, not the other way around. There is, to my
knowledge, no existing public-domain or shareware program to run
color programs on a monochrome monitor. (And no commercial
versions that are capable of running Dungeon-Master.)

I own an Amiga. It replaced my Atari ST. Enough of that... here are a couple of comments...

> 1. File Formats.

> IFF is a good idea, in theory at least.

IFF is a great idea, and you can get all sorts of good code from comp.sources.amiga.

> I think that a
> 'clipboard'-type interface (like the Mac) would be an welcome
> addition.

Well, we've found that the clipboard isn't used much on the Amiga. Scratch files in RAM: are just as useful and a lot more versatile. Think of them as named clips.

> 2. Desktop.

> How come no one has come out with a better Desktop?

Well, apparently someone has. It's not PD though.

It's *hard*. One thing you could do would be to look at something other than the Mac for inspiration. I wish Commodore had.

Maybe someone would like to port my Browser to the ST?

> 3. Multitasking.

This is vital, particularly in combination with #1 and #2.

One of our 1040ST's is not working properly. It's a weird problem (they always are :-). It seems to work just fine until you run some programs or call up the Control Panel, then you get some bombs (approx 2 - 10). The GEM Desktop works fine and files can be copied with 100% integrity all over the place so the hard drive, floppy and DMA are OK. We have a 'Tracker' and plenty of machines to compare to, but if anyone can suggest what the possible fault is &/| a solution I would be very grateful. When the machine is back on its feet again the solution will of course be posted here. This may happen to you one day!

>Well if there is an OS, will there be a copy for every processor, will it
>be in shared (slooow) memory or will there be a processor running os code
No. I wonder if there is some literature about the T's there in USA; we
have the c't, a magazine writng a lot about them.
T's are different. All resources are completely local (memory, I/O ..)
and the T communicates over a serials line (with "DMA" and 5/10/20
Megabit per second). All shared devices (hard disk) are local to one
transputer (call it a "server" or whatever you like).
>exclusively passing results to the other transputers. (all of the above
>methods sound not tooo great to say the least).
Thats it! Think object-oriented: procedures for an objekt are residing
in the transputer, messages between the objects are passed through the
links. The T's have no support for virtual memory; I do'nt know who
needs it. My OS/9 or RTOS systems have no VM and I like them for not
wasting processor time in system-code...
>Same for shared resources like graphics, I/O and stuff. How ?
Like above. Nothing is "shared", everything is local (!).

3806. Disk problems (continued -- also, media-change)

Newsgroup: comp.sys.atari.st
Date: 1988-05-09 15:26:58 UTC
From: pes@ux63.bath.ac.uk
Message-ID: <2511@bath63.ux63.bath.ac.uk>
Source record: 252407

(I have no way of knowing if this is of international or only UK interest. Still, wider distribution is probably better than narrow distribution, both since Cumana are available worldwide, and because other makers may produce similar drives.)

I bought a Cumana 1-Meg disk drive (from a company called LAN) at the recent Atari show in London. Reasons for choosing this were: (a) the price was right; (b) the Cumana drive was fitted with its own internal power supply (unlike many current 3rd party drives which parasite off the joystick port for power); (c) I have a Cumana 1-Meg disk drive at work, and it works fine; and (d) LAN said the drive was ST-compatible. (Indeed, once you've gotten into the box and found the instructions, Cumana also say it is ST-compatible.) It isn't -- though it can be made to be.

The problem: I took the thing home, hooked it up, and began some simple tests. It did not seem to recognize media change -- this was tested by the simple method of opening a window on the drive, swapping (or not swapping) disks, and pressing escape to force a redisplay. After some fiddling, I'd narrowed it down, and it was related to the write-protect state of the disks. If you removed a disk and put in a WRITE-PROTECTED disk, it would detect the swap; if you took out a WRITE-ENABLED disk and swapped in a different WRITE-ENABLED disk, it would not notice. (In full accordance with Murphy's Law, the absolute worst case. I didn't try WP->WE, by the way.)

Not being shy, I opened the beast up. It contains, right next to the WriteProtect sensor, a second ('DiskInserted') sensor. A bit of experimenting confirmed that it does NOT report WriteProtected if there is no disk inserted. (The ST, of course, relies on the disk drive to report WriteProtected when there is no disk in, as this is how it detects MediaChange. {Question for Atari, of course, is, why didn't they use drives with 'DiskInserted' sensors, and use that to detect MediaChange?})

A look at the bottom of the PC board showed that both sensors went into the same three-contact plastic box (a double switch). Markings on this (tiny) switch box indicated that both switches were normally-open types, and that the centre terminal was a common terminal. So, I soldered a small bit of wire in, shorting the 'DiskInserted' sensor so that the drive always believes there is a disk in. (All this action occurs beneath the leads to the 'Active' LED, so is a bit tricky.)

Works fine now; though I've probably voided my warranty. The point of all this, though, is that this is another possible cause of the 'directory window mixed up' problem. If you are sure that your problem

is not identical disk serial numbers, you might want to check this. If you pull a disk out of the drive and put it back, and then hit Esc to force a redisplay, then EVEN IF YOU HAVE PUT IN THE SAME DISK, the drive should spin (and select light come on) as the ST has to read the header block to check the ID. If the drive does NOT spin, then the ST has not noticed the disk being removed -- which means the problem described above may apply.

If you find your drive has this problem, you have two choices, I'd say: either modify the drive (or have it done by a repair shop) as suggested above; or try to return it for refund or replacement on grounds that it is NOT, in fact, ST compatible.

NOTES:

(1) This worked for me. If you decide to open your drive up and fiddle it yourself, I WILL NOT ACCEPT ANY RESPONSIBILITY if you muck it up. Make sure you are VERY gentle, and use a SMALL, LOW-LEAKAGE, soldering iron. Also note that you will almost certainly be voiding any guarantee if you do so.

AND, if you do decide to mod it, MAKE SURE that you nobble the correct sensor switch. If you get the WriteProtect sense switch instead, by mistake, you will end up with a drive which (a) doesn't recognize disk swaps, and (b) thinks that all disks are write enabled.

(2) (As noted) this DOES NOT apply to ALL Cumana drives. The one I use at work (bought about a year ago) worked fine right out of the box. The one I have at home (bought about 2 weeks ago) did not. Cumana drives, in our experience, are very reliable beasts -- but it is not clear that they (or someone doing the repackaging, perhaps) know what 'ST compatibility' is. Also, it MAY apply to some other makers' drives. A Brand A disk drive frequently really is a Brand B drive mech, with Brand C electronics, packaged in a Brand A box. The point is, if at all possible, make sure to see the drive working before you buy it -- testing is simple, as described above. Failing that, make sure that whoever you buy it from gives you a 'statement' that the drive 'is ST compatible' in whatever terms will allow you to use local consumer protection laws to return it if it has this problem.

Cheers, Paul

> (silicon) list.

We will post a summary listing of new features and fixes at the time the product is released for external test. It is right now in internal test, with development (ie new things) essentially frozen. We have taken some extra time to add performance enhancements beyond those originally intended, and are now doing multiple cycles of regression testing against a library of some 800 games and programs, as well as "try to break it" type testing.

> Can anyone confirm this bug (Atari???) and is it fixed in the new ROMs.

It is an old GEMDOS problem, and it was fixed in an interim version of the forthcoming ROMs. However, the fix has been backed out due to potentially serious loss of data due to incompatibility problems when disks with the extra 2K get used on systems with old ROMs. The Release Notes will have a full explanation. The unused space amounts to a VERY small percentage of available disk space, even on the lowest capacity floppy drive.

> the ascii bindings may be changed by an xbios call, it's safer to use just
> the scancode. But thanks for the correction, anyway!

It is NOT safer to use the scan code, becuase the scan code for the ninth letter from the right of the next-to-bottom row of the keyboard is constant, while the position of the letter 'C' is not. INTERNATIONALIZE your programs. Don't make people hit ^B if that happens to be the key there. (I don't know if the letter C does, in fact, float...)

Also note that European keyboards have a key (called the ISO key) between 'Z' and left-shift... The left-shift key is extra wide to cover this up on USA keyboards. That's why I didn't call the USA 'C' "the fourth key from the left."

Use ASCII codes: check for ((value & 0x000000FFL) == 3). If your document says "^C," check this way. If your document says "^(ninth from right)" you should use the scan code.

As a matter of fact, it is possible to "trap" the exception vectors
to run your own routines. Compute!'s book on C Programming on the ST has
a program that does just this, called Bombsite (or something like that).
I have no permission to post the program here, and it's written in a format
that would be rather unwieldy to post, but I suggest you check out this
book; it's quite good.

3811. Blitter call

Newsgroup: comp.sys.atari.st
Date: 1988-05-09 18:44:32 UTC
From: c162-br@zooey.Berkeley.EDU
Message-ID: <3216@pasteur.Berkeley.Edu>
Source record: 252412

This is essentially the file I received on disk from Atari. This one only describes how to use the call to the Blitter, it does not give information about the internal format of the chip. If I have time, I will post the document for that (although it's much longer). BTW, this has been formatted for printout on 66 line printers already.

Read and enjoy!

------ cut here ------ ------ cut here ------ ------ cut here ------
0x40 Blitmode - Get/Set Blitter Configuration

Synopsis: WORD Blitmode(flag);
WORD flag;

Extended BIOS (trap #14) function number 0x40 (64 decimal) gets and sets the blitter configuration. If 'flag' is -1 (0xffff), then no set operation is performed, and the current blitter configuration is returned. If 'flag' is not -1, then the blitter configuration is set as follows:

bit 0: 0: set blit mode to software.
1: set blit mode to hardware.

bits 1-14: undefined, reserved.

bit 15: must be zero.

The blitter configuration before the set is returned in the low word of D0. The fields are:

bit 0: 0: blits are being done in software.
1: blits are being done in hardware.

bit 1: 0: no chip is available.
1: a blit chip is installed.

bits 2-14: undefined, reserved.

bit 15: always retrned as zero.

If an attempt is made to set the blit mode to 'hard' on a system that does not contain a blit chip, the mode is forced to software.

The reserved fields are for future blitter capabilities and other graphics chips. They should be treated as "don't care" fields and should be maintained (intact) because they will acquire meaning in the future.

This call works on all ROM versions of the operating system.

XBIOS Blitter Call - page 1

Example - from C
------- ---- -

```
#define Blitmode(a) xbios(64,a);

curmode = Blitmode(-1); /* save state */
Blitmode(curmode | 1); /* turn on blit */
do_stuff(); /* do processing */
Blitmode(curmode); /* restore state */
```

Example - from assembly
------- ---- --------

```
move.w #-1,-(sp) ; do Blitmode(-1)
move.w #$40,-(sp)
trap #14
addq #4,sp
move.w d0,-(sp) ; save state
or.w #1,d0 ; make sure it is on
move.w d0,-(sp) ; do Blitmode(d0)
move.w #$40,-(sp)
trap# 14
addq #4,sp
;
; do some processing
; (the old state is
; still on the stack)
move.w #$40,-(sp) ;restore state
trap #14
addq #4,sp
```

I saw an add by Pratical Solutions for a RGB to composit video adaptor. I have also heard of a genlock device that takes in any video signal and locks it to another. I forget the name, but I will get the details. As I understand it isn't that expensive (less than $1000, I think) and gives better results that the cheap genlocks that are normally used for Amigas. Note that the Amiga has a more flexible external video sync control than the ST. If all this is true, it would give the ST a much more flexible genlock device than just a genlock designed for the ST. One could genlock a ST and Atari 800 for example. I try to find out the details and post more later. I think it is much better to try and genlock the signals rather than genlock the computer.

3815. Atari ST Virus hiding place

Newsgroup: comp.sys.atari.st
Date: 1988-05-09 22:28:49 UTC
From: apratt@atari.UUCP
Message-ID: <1062@atari.UUCP>
Source record: 252416

I have posted this to comp.risks, and I'll post it here. "PGN"
is the moderator of comp.risks: Peter G. Neumann @ rl.sri.com.

A perfect hiding place for viruses on the Atari ST has come to my
attention. The reason it's interesting is it is a place where a VERY
LARGE virus can live -- much larger than just the boot sector of a
floppy.

The hole exists because the ST formats floppies with five-sector FATs
(File Allocation Tables) even though at most three sectors will be used.
Since there are two FATs per disk, this leaves four sectors for the
virus. A boot-sector virus could be five sectors in length without
impacting the user-visible free space on the disk.

The sectors in question are logical sectors 4, 5, 9, and 10 (where the
boot sector is sector 0). These sectors are always zeroed by the
built-in formatter (I can't speak for others). The rationale, I
believe, for the five-sector FATs is so the root directory of the volume
will appear on Side 1 of a double-sided disk, so a single-sided drive
will not be fooled into thinking it can work with the disk.

I asked PGN about posting this -- about the tradeoff between warning the
friendlies and informing the hostiles about this hiding place. As PGN
pointed out, "... the underground will find out anyway. The crackers
are networked better than everyone else."

So here is my posting. The cure for an infected disk is to make the
boot sector non-bootable, and zero the four sectors listed above.

==========
Opinions expressed above do not necessarily -- Allan Pratt, Atari Corp.
reflect those of Atari Corp. or anyone else. ...ames!atari!apratt

[P.S. I don't know of any viruses which use this hiding place. I only
know it's there, and we should all be careful.]

3816. Re: Sticking up for Atari

Newsgroup: comp.sys.atari.st
Date: 1988-05-09 23:16:49 UTC
From: david@bdt.UUCP
Message-ID: <316@bdt.UUCP>

>to compete in the business/professional market. The hardware that is
>there is quite adequate for the job, if we could just get the software
>to talk and work together. And the seperate systems to talk and work
>together via networks. Sigh.

I think this is directly attributable to Atari not providing the system software components for doing it. Many parts of the original Mac OS were awful (if you ask me), but they picked a way to do it, did it, and then told developers how to use it. It's still not great, but it's there.

A similar story goes for Microsoft/IBM too. Nothing is pretty; it's just documented and supported. By that I don't mean they provide good support; I mean that it exists in large numbers and is "standard".

With the Atari, every developer is on their own to "hack" whatever they need that's not "supported" by Atari. If you propose it to the idiots there (in management), they say "See figure 1." So you're left either making your program live within the constraints imposed by Atari, or "doing it your way" and being made an outcast in Sunnyvale.

Even if a group of developers agree on "standard" methods, there's no guarantee (without "support" from Atari) that things won't break or be redefined by Atari in the next ROMs (something you apparantly don't have to worry about with great frequency).

Atari leaves it up to the third parties to "fix" and "improve" their system, but then Atari doesn't support the third party either!

So we end up with the pot pouri of incompatible software that we have today. Each developer telling all the other ones that they did something wrong, making their program incompatible. Each developer with their own idea of the "correct" way to do things on the Atari. And Atari only says "don't do it at all."

>i have read of clock chips that are installed under one of the ROMs.
>what is/are the name/number of this/these chip(s)? how does one go about
>setting the clock, or does it come pre-set? anyone have information on this?

The chip (actually a circuit module in a DIP socket) is the Dallas Semiconductor DS1216E SmartWatch. There is public domain software, written by TransTech in San Diego, that will use the SmartWatch in any ST rom socket (including cartridge sockets). TT was selling them for about $25 a while back. I don't know if they're still distributing them, but you can try calling them at (619) 283-9328.

Caution: it is physically impossible to install the DS1216E in a 1040ST without cutting into the power supply bracket. The bottom of the pan just clears the tops of the TOS roms as it is.

Alternatively, Radio Shaft will sell you a SmartWatch locally, sans Atari software, at a considerably inflated price.

>For all of you who have been ragging at Atari for its poor support, it is
>always the same reason, namely the Tramells. Have it ever occured to you
>that the reason it may not be as good as Apple or others is because that
>the price of the Atari stuff is too low to provide enough revenues to
>pay for the kind of support that you want? ...

Have you checked out the profits reported by Atari Corp? And take a look
at how much cash they have too. They are making a bundle! Money, at
least the lack of it, is not the reason that Atari doesn't support the ST.

To clear up another point, when I'm talking about "support", I don't
mean just answering the telephone and such. I'm talking about a lot
more than that. Trying to call IBM or Apple or Microsoft is often
a major waste of time. I'm not complaining (too much) about that.

When I talk about "support", I mean overall support, in terms of
marketing, development, documentation, dealer support, developer support,
and software maintenance, among other things. The biggest "support"
is to have one helluva lot of systems out there - like 10 million as a
starting point. To get that many systems sold, you have to do
the things I call "support" right first.

The point is that to me "support" means total support, not just the usual
meaning of tech. support. Tech. support is just one aspect of "support".

It's my understanding that the RESET makes it to the Host Adapter board,
but doesn't go any farther than that (i.e. it's not passed on to the
SCSI controller).

I believe that this is not unique to the Atari HD. I think it also
applies to the Supra host adapter too. I don't know about ICD. I think
BMS is the only one that passes the RESET to the SCSI controller. It
appears though that Supra does some special things on RESET.

I tried to send a letter to the digest earlier today, but I think I got the address horribly mixed up. Please forgive me if this letter appears twice.

Hartmut Semken,
I read with extreme interest your letter on using the Hsync and Vsync lines on the ST as a genlock input. But, since I really know nothing about the subject, I am left with many questions.
First, I am guessing that Hsync and Vsynch apply to the RGB lines. What kind of output does the VCR have to have (composite or RGB)? Second, is it possible to do what you described without an RF modulator? When you were using the external inputs, what did you use for screen output?
I guess what I really would like is to ask you if you would PLEASE PLEASE PLEASE post the information on what you did and how you did it. Code, hardware, video equipment, etc. I think I can speak for at least a few others when I say we're dying to know!
I also bought my ST expecting a genlock "real soon now"...

[]

Does anyone happen to know about the hold-up in the shipping
of Mark Williams 'C' ver 3.0 ?

Sent in the $$$$ about a month ago and have seen nothing. Are they
experiencing a late breaking Bug?

Thanks

rich

>That is what I have heard. If it is true, then it is the biggest scam
>around.

What you say may be true, however, as I understand it, there is no
question about whether both sides of a SSDD disk are usable, its whether
both sides can be used with assurity at the same time. Again, as I
understand it, a DSDD disk has a slightly thicker platter so as to
separate the two sides more. This prevents interference when reading.
Remember that reading a disk means electronically reading the magnetic
encodings. If, when reading the top side, you pick up the bottom, well,
you are going to get garbage. I have heard of many people using SSDD
disks as DSDD without difficulty, but they make sure they have backups.

3826. Shiraz Shivji reveals future Atari plans

Newsgroup: comp.sys.atari.st
Date: 1988-05-10 12:56:11 UTC
From: steven@cwi.nl
Message-ID: <311@piring.cwi.nl>
Source record: 252426

Shiraz Shivji was interviewed at the Hannover Fair by the Dutch monthly Atari ST News, and I thought net readers might be interested by some of the things he said. What follows has been translated to Dutch by the paper, and then back into English by me, so it might not reflect *exactly* what he said.

"The ST will remain the most important product for Atari. For instance [there is a world-wide shortage of memory chips]: all memory chips that we can get go first to the ST range. Only then do we use them for the PC range. [...] We will offer a path to connect ST's to the TT".

"In contrast to the past, when Atari was known for its 'vaporware', we are going to be much more careful with announcements of new products. We want to get rid of that bad image that we announce all sorts of things that are only years later available, or even are never produced."

He then went on to talk about new Atari products:

- The EST (Enhanced ST) will be the next item in the ST range. 68000 processor at 8MHz, but with higher resolution in both mono and colour, and more colours. Improved VDI, upward compatible with the ST, with for example, horizontal and vertical scrolling. Expected availability: end 1988

- A removable hard-disk, the SR244. The disks have the size and form of a compact-disk box, and will cost ~$120. Cost of the unit itself will be little above the current hard-disk price. Capacity 44Mbytes per disk. Access time 25 msec. (The SH205 has an access time of 65 msec, as a comparison.) It shouldn't be long before there are 60 and 80 Mbyte disks with 15msec access times. Expected availability: 3rd or 4th quarter of 1988.

- A number of new, non-exchangeable, hard-disks, with a much larger capacity than the SH205. Available: in around three months time.

- The CD Rom is expected to be available everywhere in 2 or 3 months time. Price: around $600.

- The TT computer: 68030 processor, 68882 floating-point co-processor, VME bus, Unix V system 3.1, possibility to connect an ST to the DMA port. The ST will then run X-windows. It may be possible that GEM will then run in one of the windows. Price: around $5000. Available: end 1988.

- They have found a new manufacturer for the blitter chips and expect to catch up on back-orders "in a few months".

- Atari has just been having high-level talks with Digital Research. No information about what.

- A portable ST is being developed. No dates for availability.

On this last point, in the May Personal Computer World, a British magazine, a reporter tells that Sam Tramiel assured him that the portable ST should be available by Christmas, at around $1000. The machine, called the Stacey, is being prototyped by Perihelion in Cambridge England (who are also doing the Abaq, by the way). Planned is: 1Mbyte RAM, hard disk, floppy disk, full-screen LCD screen, tracker ball instead of a mouse. Memory shortages may mean that the first versions will have 512K of RAM. Pricing considerations may mean that the hard disk will go.

I've heard from no one else about this problem, so you may have a hardware
failure. You weren't trying to run Turtle and TURBODOS together, were you?

Meanwhile, if anyone in the US is having this sort of failure, let me know,
and I'll try to work with you to determine the source of the trouble.

3828. Re: clocks that fit under ROM chips?

Newsgroup: comp.sys.atari.st
Date: 1988-05-10 14:36:30 UTC
From: davidli@umn-cs.cs.umn.edu
Message-ID: <5329@umn-cs.cs.umn.edu>
Source record: 252428

There was a reent article describing how to use a clock-in-a-chip, including installation and software in the April issue of ST X-PRESS. Title of the article was something like "The $25 ST clock" or some such. You might look there first to determine whether you want to build your own or purchase.

(Looked nice enough, but I already had a clock cartridge for my ST, so I didn't try it out...)

>... A division company, to be known as Atari Computers, is being formed.
>
>Since it is not dated April 1, I assume it is for real. If so, it may be
>the answer to all those that have been Atari bashing lately.

Sounds interesting, but if all of the Computer business is one division what
does everyone else do? Video games? I'm thinking this would make the org
chart something like ...

```
Tramiel Bros...
|
+--------------------+-----------------------+
Babbitt ???????
Atari Computers VideoGames (2600 et al)
| |
+-------+--------+
Roy Neil ???
(SW) (Mktg) (HW)
```

Wonder if they can pull it off. They definitely need to restructure it in
some way. There is no way they can sell a UNIX box (aka '030) without a
fully staffed customer support division...

3831. Fix for ETERNAL to work on Mega STs

Newsgroup: comp.sys.atari.st
Date: 1988-05-10 18:53:55 UTC
From: VBRANDT@DBNUAMA1.BITNET
Message-ID: <8805101853.AA24225@ucbvax.Berkeley.EDU>
Source record: 252431

I recently posted an enquiry to this newsgroup concerning my problems running Turtle and TurboDOS om my Mega ST 4. As an aside, I mentioned that I was able to fix ETERNAL to run with 4 MB.

Several (in fact, two ;-) people emailed me asking what the fix for ETERNAL was. Since this might be interesting for other people also, I decided to post it here. Please do not hesitate to correct me if I'm wrong. Here's my view of what happens:

One of the few differences in hardware between the 'regular ST' and the 'Mega' is the behavior of the system when a non-existant memory location is read. Remember that the ST 'MMU' can handle up to 4 MB RAM. Trying to read a non-existing memory location that is below 4 MB merely returned garbage data (I think it was a constant but I don't remember which) on the 'old' ST. Doing this on a Mega gives you a bus error (two bombs).

The system variable '_phystop' points to the first non-existant memory location (on a 1040 ST, to $10000 = 1 MB). This value is decreased by ETERNAL to protect the RAM disk area. The RAM disk effectively pretends to 'just not be there'. Therefore, after installing ETERNAL, _phystop points to the first word of the RAM disk area. This word is the start of the RAM disk BPB and contains $200 (sector length in bytes).

When starting ETERNAL, the program determines if it is already installed by simply reading the first non-existant memory word and checking if that turns out to be $200. If it doesn't, ETERNAL installs itself. If it does, ETERNAL just tweaks the three hard disk vectors to point to the RAM disk driver which it assumes to be there.

On a Mega ST, the attempt to determine if ETERNAL is resident results in -- you guessed it -- a bus error. What I've done is to check if _phystop is exactly 4 MB -- ETERNAL can't be installed then, right ? This makes my version of ETERNAL work with the old STs and with a Mega 4. I'm not sure what to do about a Mega 2. Checking for exactly 2 MB won't do: suppose you have a resident utility using up exactly 2 MB on a Mega 4. What should ETERNAL do in that case ?

I've also changed the installation procedure: my configuration utility now modifies the executable directly, thus eliminating the need for a separate read-in of the data file ("\AUTO\RAMDISK.DAT") and speeding up the boot process a little. A possible solution would be to add an option to the configuration program allowing Mega users to specify their memory size (2 or 4 MB) that _phystop is checked against.

Other improvements I'm planning to add are:

- displaying a message stating drive identifer and disk size, and whether it's a first-time installation or a restart
- setting up a complete boot sector so that disk editors, unerase utilities and the like have a better chance to work on the RAM disk
- incorporating the resident driver into the boot sector, thus saving the grand total of 512 bytes (wow!)

If anyone's interested in my ETERNAL, email me. If there are enough people who want it, I'll post it (the improvements will take a while yet ;-).

3832. clocks for the cartridge port

Newsgroup: comp.sys.atari.st
Date: 1988-05-10 19:52:10 UTC
From: sandra@utah-cs.UUCP
Message-ID: <5481@utah-cs.UUCP>
Source record: 252432

On the subject of clock chips, does anybody have recommendations for a clock chip that plugs into the cartridge port? I don't really want to have to mess with the innards of my machine, or do a great deal of programming to get the thing to do anything useful. I saw one such beast at a local dealer several months ago, but it appeared to have a limited lifetime and no way to replace the batteries. It also set up a bunch of useless (to me, at least) desk accessories. Is there anything better on the market?

-Sandra Loosemore (sandra@cs.utah.edu, sandra@utah-cs.uucp)

3833. Turbodos

From: good@atari.UUCP
Message-ID: <1063@atari.UUCP>
Source record: 252433

May 10th, 1988

TURBODOS

The following is the statement from Atari France regarding the use of
the Turbodos product. I have paraphrased for simplicity.

1 Source code belongs to the contractor, Dominique Laurent, and not to
Atari France. It is the copyright of both Dominique Laurent and of
Atari France.

2 The latest version is 1.05, which includes some fixes for settime
and setdate.

3 The product was developed by Dominique Laurent, but belongs to Atari France
for all commercial purposes. If you wish to give a copy to a friend, you
may do so. However, if you intend to include the product as part of a
sales promotion or similar, you must seek and obtain the agreement of
Atari France.

4 Each Atari subsidiary, at least in Europe, has been authorized by Atari
France to include Turbodos with any SH204/205 disk drive sale.

Atari France may be contacted at: 9 rue Sentou, 92150 Suresnes, France
The technical contact is Eric Cabedoce.

Please address any further queries regarding Turbodos to Atari France.

Thank you.

Roy J. Good
Product Development, Atari Corporation

Views expressed are my own. Atari may agree or disagree; they have the right.

Source record: 252434

Bill...
Having done some private and public domain programming, my Ataris (stock 800XL, 256K 800XL, color 1040ST) have come through with hardly a hint of trouble. The only major trouble I've had came about recently with the 800XL and the two US Doubler-enhanced 1050's I have. The case and keyboard on the XL is looking pretty shoddy (hey, I've only taken it apart a couple of hundred times -- there's the 256K upgrade, the coldstart button, the function key kit, etc) so I had to order and install a replacement, and

the two 1050's have finally hit their limits (after all, the 800XL is only one of the first 50 XL's ever produced, and the 1050's are ONLY about 5 years old) and are getting repaired. The only time I've seen a piece of Atari hardware really and honestly all-out fail was at a computer store when the salesperson DROPPED the disk drive and it wouldn't read. Granted, the "new" Atari IS a bit thrifty when it comes to workmanship, but Atari has always had a reliable service record and I think you were a littl

e harsh in your comments.

By the way, the Astra System HD+ is, as you say, built rock solid. I know someone who uses one constantly and has had it dropped, kicked, banged, and generally abused and it has run without a hitch.
-STeve

3835. Re: AD&D Character Generator

Cross-posted to: rec.games.frp,comp.sys.atari.st

That's all fine and well.
That's all just fine and well.

ANYBODY can write a D&D character generator program! ANYBODY! They can even make it a darned good one! I wrote one on my IBM PC in my SLEEP for crying out loud!

What I'd really like to see is the source code (ANSI C preferrably) for a character generator for CHAMPIONS(tm), the Super Hero Role-Playing Game. Try writing one yourself some time! It is nearly IMPOSSIBLE to make a Champions(tm) character generator that lets you use all the options. Heck, I don't even want to THINK about programming in options for Multipowers or Variable Power Pools! Anybody who could make one of these would earn my award for Best Applications Programmer of the Year.
Then everybody could create/alter the "printout.c" file to suit their terminal, their printer, and their taste.

I cannot say about an Amiga ST Emulator, but I can say that I have
read on GEnie that David Small, creator of the Magic Sac cart, that will
transform the ST into a Mac with 64K roms, is now working on an Amiga
emulator for the ST.

Perhaps you might have read or sean something backwards ????

3837. Re: Bomb list

Newsgroup: comp.sys.atari.st
Date: 1988-05-11 08:01:01 UTC
From: wes@obie.UUCP
Message-ID: <228@obie.UUCP>
Source record: 252437

In article <12463@tut.cis.ohio-state.edu>, weaver@tut.cis.ohio-state.edu (Andrew Weaver) writes:
> Is there a way to intercept the 'bombs' that come onto
> the screen with some sort of dialog like on the Mac [...]
> or on the Amiga: [...]

Sure. The bombs are drawn on the screen by the default handler for the following processor exceptions:

2 Bus error
3 Address error
4 Illegal instruction
5 Zero divide
6 CHK instruction
7 TRAPV instruction
8 Priviledge violation
9 Trace trap
A Line A emulator
B Line F emulator
C Reserved
D Reserved
E Reserved

You could simply write a Ptermres program that points the vectors for these exceptions (except Line A and Line F) to your code, and have the code pop up an alert with some useful information. The bombs tell you which exception you got, however, and the information about the processor's context at the time of the crash is stored in a buffer in low memory so you can access after a crash, even after a warm boot.

I have an SH204 that is 18 mos. old and going strong. It has never
crashed of it's own accord. I have always had very good luck with
Atari hardware. As with any hard-disk, you can break them really easy,
but if you don't bounce them, they seem to be pretty reliable.

I don't know anything about Supra drives, but I never heard any complaints
from the people I've known that owned them. They "seem" (sound) like
better machinery than an SH204.

Just curious, did you try contacting the dealer, or Atari? I have heard
a lot of just out of warrantee stuff being replaced while in the vicinity
of customer service.

I did contact the dealer and they said it was not possible. I should
have talked directly to Atari though. It turns out that the index
sensor on the disk was dead so the disk could not find out the position
of the heads. The repair shop borrowed a sensor from another disk and
managed to get the data off the disk. A new sensor will be installed
later this week. I picked up a Supra drive last week since I couldn't
wait for the Atari disk to be fixed. It is much quieter than the Atari
drive.

Anybody want to buy a slightly used SH204 drive?

> 1) What, if any is the relationship between IFF and TIFF??

None. IFF was developed at Electronic Arts as a file format to allow various Amiga applications (and a FEW ST applications) to exchange data. TIFF was developed by Microsoft, Aldus (of PageMaker fame) and the makers of some scanners, most notably Dest, for storing scanned images and moving them between various resolution-independent applications.

> 2) What is the standard 3 character file extension for TIFF files?

It is `.TIF'.

3847. HP DeskJet

Newsgroup: comp.sys.atari.st
Date: 1988-05-11 17:17:56 UTC
From: HEIMBIG@WSUVM1.BITNET
Message-ID: <8805111716.AA15635@ucbvax.Berkeley.EDU>
Source record: 252447

Several people have asked about the HP DeskJet. I ordered one for the
student lab I manage here at Washington State U. it came in last week
and has been in solid use since. Observations:

-quality- (of output) is variable, generally better paper produces better
results, but not necessarily, 100% cotton rag paper produces output
indistinguishable from laserjet, but the cheapest paper we have
is also very good, in general photocopy paper is good but some are
better than others. The manual warns about this and suggest try before
you buy a bunch paper. Resolution is 300*300 and dot size is either the
same or very similar to a laser.
There is a draft/letter quality panel button, in draft the print head
goes twice as fast prints half as many dots uses half as much ink,
and looks better than any pin printer. Letter quality is laser quality.
Remember this machine, like a laserjet, uses single sheet cut paper and
autoloads it from am approx. 100 page compartment.

-compatibility- the deskjet is compatable with the anything that will
run a HP laserjet or jet plus or jet II. Lotus and MS Word (on a PC
sorry no ST's in the lab to try out) with laserjet as the printer diver
both worked fine. Also the manual came with a disk with drivers for Word,
WordPerfect, lotus 123 and Framework. Also we bought an epson FX 80
emulaton cartridge which works fine, hi res but with epson fonts and
use epson printer drivers (haven't tryed graphics with the epson emulation).
With the high degree of compatibility to hp laser jet I would not buy the
Epson emulation cartidge.
As far as I can tell the cartidges for the deskjet/laserjet are software
compatible too, that is the same drivers will for a particular cartridge will
work for either printer. However they are definately not the same physical
cartridge (ie you cannot exchange cartridges)

-cost- list $995, $750 at the local hp dealer, on bid we got ours for $475
from the local hp dealer. (here's a shocker this baby is manufactured in
Vancouver WA.)

-speed- is said to be 240 draft and 120 letter quality, but it just isn't
as snappy as HP's other printers, ie page eject is slow compared with 2934
(tho it is considerablely faster than an epson). About 2 page per minute in
letter quality and 4 page per minute in draft, (compare laser 8 page/min with
no such thing as draft). Also there is a 16K buffer but if you send
characters to the printer fast then the printer stops printing while it
receives the data, this allows you to get on with your work but slows down
the printing proccess.

> run, (mostly games...)

Well gee Chris. I'm glad you like some of those 'nice proggies' enough to be midly interested in the emulator. Of course an ST emulator is quite impossible, unless it will include much hardware. The ST clocks a little faster than the Amiga so it would probably be a lot slower. There used to be a rumour about an Amiga emulator for the ST! The program even existed, but it was just a joke.

I'm not sure if you realize that your comment about the VW engine is not really that funny. See, the Atari ST is becoming a more and more popular computer every day. It has certainly outsold the Amiga. Nobody laughs at the IBM-PC although both the ST and Amiga are superior computers.

Also, you may note that not all of the 'nice proggies' are games. The ST has better music programs and better word processing than the Amiga.

Why is it that Amiga users get so pompous? I recall seeing a message on the Atari Co. BBS where a frustrated Amiga user had a lot to say to all the Atari ST users. It was really very silly, and only makes the Amiga users look bad.

From: georgew@tekig4.TEK.COM
Message-ID: <2815@tekig4.TEK.COM>
Source record: 252450

A year ago, I read some articles from people who were talking about making enhancements to proff (a simple nroff subset, for those of you who don't know what it is). The version of proff that I have dates back to 1985 and it has always annoyed me that in underlined text, it underlines the punctuation (unlike the nroff default). I could write a trivial post-processor to clean this up, but it occurs to me that someone may have fixed it in proff, as well as adding other nifty features. Also, I posted a small set of ms macros for proff a couple years ago. If anyone has expanded on the set I posted, I'd like a copy.

3851. High pitched whine -- Definite ouch!

Newsgroup: comp.sys.atari.st
Date: 1988-05-12 03:15:54 UTC
From: al671@unh.UUCP
Message-ID: <468@unh.UUCP>
Source record: 252351

I don't know how common this problem is, but my 1040 ST emits a high pitched whine whenever it's in operation.

I had this checked out about 1 month after I bought the system, and was told that the sound is probably a sub-frequency of the switching power supply.

Whatever it is, it's *very* annoying, and I wish to make it stop.....

Any hints or suggestions? Note that I'm not a hardware hacker, so please include copious instructions (unless your suggestion is to bring the ST to a _real_ repair shop :-).

Many thanks.

> >together via networks. Sigh.

Actually the hardware isn't there. I have yet to see an Ethernet/TCP/IP
link or an ST network(!)... tho' MacWeek did mention that TOPS was suppose to
be working on TOPS for the ST ... the Mac has AppleTalk/TOPS and third party
Ethernet connections for the SE. The ST has a promised "PromiseLAN" network
(which all sounds kind of recursive to me). Business need networking. More
important, businesses need networks that are independent of vendors
(Ethernet/ TCP/IP, NFS, TOPS all come to mind).

> I think this is directly attributable to Atari not providing the system
> software components for doing it. Many parts of the original Mac OS were
> awful (if you ask me), but they picked a way to do it, did it, and then

> A similar story goes for Microsoft/IBM too. Nothing is pretty; it's just
> documented and supported. By that I don't mean they provide good support;
> I mean that it exists in large numbers and is "standard".

Agreed. The Mac environment is going to pay for their awful overall design
in the long run...just as the ST will also have similar problems.. The
difference is that Apple supported their developer community. It is easier
for Apple to make drastic changes to their OS in the next few years (like
adding multi-tasking and color attributes (24 bitplane stuff)) because the
developer community is better supported and of course their is something
in it for them. The flip side is that similar changes to the ST may see
developers wandering off and spending their resources on higher volume
and better supported machines.

Why has this come about :
Atari's developer problems stem from :
1.Pre-announcing products way too early and promoting unrealistic expectations.
(the blitter and Megas come quickly to mind)
2.Not providing a hard set of user interface guidelines
3.Not providing a generalized font and device mechanism that is standard with
the OS.
4.Licensing GEM and then not maintaining up to date DRI versions.
5.Not providing a network option that is of general value (Ethernet, AppleTalk)
6.Not providing ongoing contact with and documentation updates to developers.

It should be noted that only #5 is hardware. The other points are procedural (#1,2,3,4,6) for the most part. For example : a generalized font mechanism exists (in the form of GDOS) it is a procedural matter why it is not part of the OS a user receives with his/her system.

Naturally My Opinions are my own....and I could be wrong :)

>to try and genlock the signals rather than genlock the computer.
>
> Wayne Knapp

In most normal situations there is a way to acccomplish a gen-lock situation.
That way is to Gen-lock the VCR to the ST. This has been done in
theory and in practice as I will explain in a bit. To accomplish this we take
the Horizontal and Vertical sync signals from the ST, buffer them (so not to
blow up the GLUE chip, experience dictates that (:>)) and feed it into the
Horiz. and Vertical sync inputs on a Home VCR. The VCR will require modification
by an experienced video engineer. Now that that is accomplished one has to now
take into consideration timing. (Timing ???) For the video signals to mix
properly, without a horizontal shift or a color shift, the two signals must
be in perfect timing at the point of mixing. If you watch TV for any length
or time you will see at some point in time or another, a horizontal shift occur
immediatly after a dissolve or a wipe. This is caused by poor horiz. timing.
If you see a color shift it is due to poor subcarrier timing. This will also
hold true for keying also, but I digress. In Springfield Ill., there is a
TV station that uses some consumer beta machines on air. These machines were
modified to accept external sync and subcarrier and the output of those machines
are then fed into a time base corrector (horizontal freq in asynchronous,
horiz. freq out synchronous) and then to the switcher.

In the case of the home VCR we are using the ST as the "standard"
and are "slaving" everything else from it. Is it worth it? Not really,
unless you are really set on doing it. The right way would be to "slave"
the ST to whatever you are feeding in. To really do it right would require
a good TV sync generator driving all of the other equipment including
using the outputs from the generator to drive the ST. I have seen many ads for
genlock accesories for the ST but have not ever seen any product from the parties
that offer it. Being an RGB analog output, it would be nice to see an inexpensive
effects switcher with chroma key capabilities for home use with an ST.

If all of this sounds confusing, it is probably because it is! (:>) Think
about this one. Digitize a video signal. Store it in RAM. Let an external
source clock it out at any rate it wants to. Now do it in real time.
Now do it in color!
That is what you need to have to build a frame-synchronizer. With that you
don't need to genlock the ST. Just genlock the frame-syncronizer.

>
>The sectors in question are logical sectors 4, 5, 9, and 10 (where the
>boot sector is sector 0). These sectors are always zeroed by the
>built-in formatter (I can't speak for others).

Since I'm the person (or at least one of them) responsible for bringing
this to Allan's attention, let me expand on it a bit, and hopefully head
off a potentially false solution.

I've been spending a fair amount of time examining suspected virus disks
sent to me. I will continue to do so. If you suspect a disk of bearing a virus,
send it to me, and I'll check it out. If there is a virus on it, I'll add
a kill for it to the next generation virus killer.

>[P.S. I don't know of any viruses which use this hiding place. I only
>know it's there, and we should all be careful.]

I do!

One of the virus disks I have contains logic which loads an additional sector
from the disk, one of the FAT sectors Allan mentioned. Note, however, that
it determines which sector to load by examining the disk configuration data
in the boot sector. It checks the FAT size, and the number of reserved
sectors, then determines the last sector in the first copy of the FAT. It
loads that sector, and attempts to execute code it expects to find there.

So, anyone thinking that writing a formatter which allocates only three
sector FATs, don't bother. You will not only fail to stop the spread of the
virus, you'll also get any files on the tail end of the disk wiped out.

My next generation of virus killer will check and zero (after requesting
permission) the unused FAT sectors. As Allan states, that's the safest way
to deal with the problem.

Meanwhile, if you suspect a virus, send the suspect disk to:

George R. Woodside
5219 San Feliciano Drive
Woodland Hills, Ca. 91364 (USA)

Thank you.

From: ins_bjjb@jhunix.HCF.JHU.EDU
Message-ID: <6430@jhunix.HCF.JHU.EDU>
Source record: 252355

I've read numerous articles about the forthcoming 16MHz upgrade for the Atari ST. Completely TOS/GEM compatible, $200, zowie, etc. It's recently occurred to me to wonder whether this will aid the Magic Sac, Translator, and pc-ditto.

I don't think it will work with the Translator at all, because of some of David Small's comments in his Current Notes articles about speed problems between the Translator and ST. I'm not sure about the Sac or pc-ditto, and I don't recall reading anything about the results using these two emulators.

Needless to say, a 16MHz Mac with larger screen, faster hard disk, more memory (maybe), etc. would be a real brain blaster. Not to mention a 2MHz (?) PC . . .

Speaking of memory, I'd also like to ask about RAM upgrades for a 1040ST. Cheapest, best quality, best supported, etc. Also, what is their effect on software (i.e., does anything die painfully and/or destructively with 4 megs in a 1040) ?

I have an annoying problem with a time and date setting program that
I believe has been mentioned before. The program insists uses the
old date stamp as a reference and every month when I enter the new month
it is advanced to the next month ie when I enter 5/01 the system
shows the date as 6/01. Does this have something to do with leap year??
Any fixes??

Also, many of the Uniterm2.0 files did not make it to our location.
Could someone mail me parts 1, 5, 7, and 10 through 18??

From: SUMIDA@vax.oxford.ac.UK
Message-ID: <8805121535.AA07801@ucbvax.Berkeley.EDU>
Source record: 252360

I remember seeing references to TEX for the ATARI ST, especially one from Germany. Unfortunately, at the time I was not interested in TEX and consequently no messages were saved. The Oxford University Computer Centre has recently installed a local laser printer which will process TEX files. So I'm now sending an appeal for information.

>>>>> Could anyone on the net help with any information? <<<<<

I will pass on the info to local users.

Thanks,

Brian

[]

Over a year ago Atari informed its dealers on how to fix the problem
with whining 1040ST's. It turns out that the culprit is the chip
that generates the +-12V for the RS232 stuff from the main +5V supply.
This chip oscillates, with the help of a capacitor, a resistor and a coil.
All three should be replaced with new components of different values.
I did it myself on my 1040 with success: complete disappearance of
the whine. Ask your local Atari dealer for the info or a fix.
(By now I have a hard disk so my ST system is noisy again :-( )

For all of you who suffer(ed) from that whine: Some people (like me)
can hear the 15,750 Hz whine emitted by the ST _color_ monitor and all
other standard (lo-res) monitors and TV's. It is a lot louder than
that 1040 whine. It causes me physical pain. Please be considerate
with your fellow people (and animals!) when using these archaic devices.

Anxiously awaiting a full transition to higher-resolution video in both
broadcasting and computing...

- Moshe Braner

You're right, a Champions character generator would be more than
difficult to write. However, don't put down the AD&D Character
Generator. Note that its AD&D not D&D which if you ever looked at all
the possibilities and exceptions, especially through the rules
introduced in the Unearthed Arcana and the Survival Guides, you would
see that this is no easy feat. The SF AD&D Character Generator covers
EVERY aspect of making up the character (except the history, family,
etc...)

3867. Megamax v1.1 Bug?

Newsgroup: comp.sys.atari.st
Date: 1988-05-13 00:53:07 UTC
From: paone@topaz.rutgers.edu.UUCP
Message-ID: <May.12.20.53.04.1988.25733@topaz.rutgers.edu>
Source record: 252367

I have been playing with my v1.1 of Megamax C and found what appears to be a bug in c lib. argc is being initialized to 1 instead of 0 so even when no arguments are passed, argc is 1. I went into the library and patched this up, but the argv also appears to be off. Is this the case, or is this supposed to be different from UNIX's method of handling them (Yes, I know argv[0] does not work)?

Thanks,
Phil Paone

In response to Sandra Loosemore's request for experiences with clocks for the cartridge port: I use a LogiKhron module from Shanner International. It can be operated with or without a single desk accessory. It does the job. I have not been motivated to remove the screws and see if the battery can be replaced. Of course, a big hard disk with a clock in the host adaptor is the way to go :-)

To improve developer support, how about a conference similar to the recently concluded Amiga Developers' Conference. At the Amiga convention, new IFF animation standards were established, gamma versions of WorkBench 1.3 were made available to developers, and various hardware and software workshops were held, among other activities. The conference was sponsered by and well supported by Commodore and received rave reviews on the amiga newsgroup. Would Atari and Atari developers be interested in such a thing?

>pitched whine whenever it's in operation.
>
>I had this checked out about 1 month after I bought the system, and was
>told that the sound is probably a sub-frequency of the switching
>power supply.

First off, I can say that the problem is NOT from the
whine of a switching power supply in the 1040. The 1040 ST
does not use a switching power supply.

Second, I would check into the RS-232c port as the real
culpret, although I have never seen (or heard) this
personally myself, I have talked with other techs, and
such and have also read , that the RS-232c was the problem.

This being especially, with a Club members machine (1040 ST also)
which he took the machine, and was repaired with in two days.

If you havn't taken you machine into a authorized service station,
Then I suggest that you should.

If you're handy, or know of someone that is, change the
two rs-232 chips in the machine. They can be had at any
local Radio Shack store, both for less than $5.00, including
chips sockets. I will suggest that *if you do decide upon
this route, place in the chip sockets, and be carefull of
the foils, as there is one in particular, that will lift which
will make you have to use some extra hard wiring to repair.

3875. Converting images for various devices

Newsgroup: comp.sys.atari.st
Date: 1988-05-13 04:51:52 UTC
From: seitz@cory.Berkeley.EDU
Message-ID: <3309@pasteur.Berkeley.Edu>
Source record: 252375
Cross-posted to: comp.graphics,comp.sys.atari.st,comp.sys.amiga

I'm interested in writing a picture format conversion program. My main obstacle is in writing routines to convert an image from on display capability to another. Basically, I'm looking for an algorithm which will take an image created on one device and convert it to one which can be displayed on another device. The algorithm would be given the following information:

1) The height and width of the original image.
2) The height and width of the target display device (this can be infinite if sliding windows are used).
3) The red, green, and blue intensity of each pixel of the image.
4) The x:y ratio of the image.
5) The x:y aspect ratio of the target display device.
6) The number of bits used to represent the intensity of each color for the image and the number of bits used by the target display device.
7) Restrictions on the palate, such as
a) all colors can be used (Amiga HAM mode);
b) A fixed number of colors can be used, but they can be any which can be displayed by the computer (Amiga/Atari color, IBM EGA);
c) The palate is fixed and not all combinations of RGB can be displayed (Atari Hi-Res, Macintosh, grey-scale devices);

If such an algorithm has been implemented, could you please pass the source along to me. Thank you.

rumor has it (a reliable colleague, reading something on CI$) that a company called xetek is making a floating point chip add-on for the ST, and should realize performance improvements of 2-30x (obviously on code dominated by floating point ops normally done in software on the ST). code has to be recompiled. don't know what happens to line F with this implementation. they are also s'posed to provide a library for flops. company is in Salina, KS. cost: circa $200...

anybody hear any more on this?

I believe somewhere in one of the Champions supplements (possibly an old Adventurer's Club or one of their modules) exists a bunch of tables for creating a random Champions character. The character that came out could be pretty wierd. The basic way it worked was that you chose from a list of classes like Energy projector, Martial Artist, Brick, etc.. and then rolled on a bunch of tables to find their powers, skills and disads.

Does anyone out there remeber where this thing was?

There is always at least 1 argument, the name of the program itself. It
is the same way on the UNIX as on the ST as in any implementation of C.

3880. Re: Personal Pascal v1.1 vs v2.02

Newsgroup: comp.sys.atari.st
Date: 1988-05-13 13:32:00 UTC
From: DMiddleton%pco@BCO-MULTICS.ARPA
Message-ID: <880513133207.911854@HIS-PHOENIX-MULTICS.ARPA>
Source record: 252380

Well, I think v2.02 is a bit better than v1.1, and here is why.

First, I think that they have done a lot of good stuff with the editor. It is much friendlier, even though there are a few bugs waiting to bite. On the mostpart, it is pretty good. I like the page and line motion features and the dropdown menu selection usage is much improved.

The compiler has a much more rigous compilation method which enables the user to selectively define the amount of run-time checking. As one might expect this can generate a lot of executeable and object, so if you are a lowly SS drive user, youmay get a nasty surprise.

And that is really the story. If you have one SS drive, you can get it to work, but wow will you have trouble. It comes on 2 (count em) 2 diskettes which makes it tough for a single SS compiler user to run. If you have the bottom of the line 520, NOW you have trouble because without a RAMdisk or a second SS drive, you might not be able to work effectively.

The good news is that they have added to the repetroire of subroutines in the libraries and now you can blast copies of screens hither and yon. VERY useful when working with dialog boxes. The documentation is 2 to 3 times thicker and is both readable and useful.

There are bugs, and ever since ICD took over PP from OSS, well really BEFORE that happened, no updates were coming out. Promises of free updates to "bug finders" were so many nice words. I know since I have found several weird errors. This includes having to centre dialog boxes since the clipping region for the dialog box is centered. Ever hear of disappearing dialog boxes? Now you have! How about the event routine which cant detect mouse clicks where a menu bar used to live? Hope you know how to use a timer. How about the diabled menu bar item which leaves the machine thinking a menu has popped down but didnt really? Can you say "inverse video data on a screen" - Can you say 4 bombs?

Honestly though, although these are real problems, how often will most people run across them? It does compile and the programs do run ok. With a DD drive or two SS drives you can do ok. A meg wouldnt hurt, but chip prices are another story.

I havent had problems with the linker at all! The configuration technique to locate programs is not too bad, even though it can forget where something resides between boots.

Last gripe, then I'll quit. The only thing they really forgot in the editor was being able to remember how big a tab is. Since I don't like 8 character tabs, then I have a problem. Maybe you won't. If I set it

to 2 characters, it forgets event between compiles. Sigh.

So overall, I think it is pretty good. Too bad they want your manual and old disks though. They never asked me for mine. I just sent in the $30 US and the stuff came in the mail. That is why I can compare the two versions so well. I have both! And they both work well. I prefer 2.02!

Well, it is up to you if you get it, but there is value added. I'm glad I got mind.

From: michel@megamax.UUCP
Message-ID: <1374@megamax.UUCP>
Source record: 252381

argc was set to be 1 always because of compatibility with UNIX(TM). A lot of programs count on the name of the program to be in argv[0]. The ST does not pass the name of the program so argv[0] is set to a string with nothing in it.("").

Hope this helps.

Why bother? Champions character generation was MADE for spreadsheet
packages. I've made up a nice Excel template, with borders and boxes
everywhere, lots of room for explanatory comments, and most of all,
complete freedom to hack with the equations until you get what you
want. Things like: I have a Multipower set up with an END battery.
If I want to see what happens with a different-sized END battery, I
change *one* number, and the whole Multipower recalculates. For
characteristics, I just type in how many points over/under the base
I want; it calculates derived stats (END, STUN, &c), calculates the
point cost, instantly. And this is really really easy to do.

Heck, a spreadsheet is MADE to let you interconnect a bunch of equations
and play with them. What could be more perfect for Champions?

I doubt if there is an ST Emulator on the Amiga. Even if there were, it would be terribly slow. Same if there were an Amiga emulator on the ST. Both machines have a fair amount of system specific hardware (esp. in comparison to the Muckintosh).
In article <779@leah.Albany.Edu> jac423@leah.Albany.Edu (Julius A Cisek) writes:
>Why is it that Amiga users get so pompous? I recall seeing a message on

Because their hardware is better. But then again, the Atari 800 has better hardware than the apple][and C64; nicer OS too. The Mac and PCs are not as hot hardware-wise (except for the macII and 80386). So there's hope yet for Atari. Remember Atari Computers, "ship out or suck d**k" ;-]

3888. Uniterm is missing ...

Newsgroup: comp.sys.atari.st
Date: 1988-05-13 19:51:00 UTC
From: mitsolid@acf5.NYU.EDU
Message-ID: <910002@acf5.NYU.EDU>
Source record: 252388

There is something that uniterm lacks, flash has and I am missing.

Assume that you want to login into different systems
with different boud rate and different RS232 settings in general.

Flash allows you to atach to each telephone number the baud rate
to be set BEFORE the call. Very convenient.
Also, after the call flash allows you to set the RS232 to whatever
you like through a macro.

In uniterm one has to do all the above changes by hand
(there is only the option of creating many setup files
but that is hard to mantain)

While this is the only feature I am missing from uniterm,
I would like to thanks Simon for the best terminal emulator
I have ever used.

TO: UUCJEFF@ECNCDC.BITNET

Are you currently using ADAP? How is the the latest release of the software? I was thinking of getting ADAP when it first came out, but I decided to wait for the improvements. I have a Fairlight series III manual, but it is out of date 'cause I never bought the instrument and never updated the manual. Quite frankly, I think the CMI is way overpriced. I'm into human voice analysis and music, so I would be interested in your experiences with different sampling software and hardware.

3891. Are disk caches safe?

Newsgroup: comp.sys.atari.st
Date: 1988-05-14 02:32:47 UTC
From: seitz@cory.Berkeley.EDU
Message-ID: <3343@pasteur.Berkeley.Edu>
Source record: 252392

After all the discusion about the dangers of TurboDOS, I'm hesitant about using any disk cache, including the one posted to .binaries. As I understand it, disk caches which do any sort of write buffering are inherently unsafe because there is no simple way to be make sure your information is actually written to the disk. Does the cache posted to .binaries do any write buffering and, if so, can you be sure that the buffer is written to disk, short of exiting the current program (an accessory to dump the buffer, for example).

3892. synchronizing the ST to an external video source

Newsgroup: comp.sys.atari.st
Date: 1988-05-14 04:53:28 UTC
From: hase@netmbx.UUCP
Message-ID: <1832@netmbx.UUCP>
Source record: 252393

I think this is interesting not only to Michael Kieras, who asked me about "gelocking" the ST to an external signal.
Please hit "n" if you do not know the right side of the soldering iron...

>Hartmut Semken,

Just call me hase, like everyone does..

> I read with extreme interest your letter on using the Hsync and Vsync >lines on the ST as a genlock input. But, since I really know nothing about the subject, I am left with many questions.

I'll try to help You; does nobody else know about this?

> First, I am guessing that Hsync and Vsynch apply to the RGB lines.

No. They are just the synchrinisation lines for the ST video output; a pulse on HSync tells the Monitor (RGB or monochrome) to start a new scan line, VSync tells it to start a new screen. The frequency of 35 kHz on the HSync line (in monochrome video mode/high resolution) can be hazardous to color monitors (they exspect 15 kHz on this line) so be careful (a friend of mine killed his green monitor this way..) ! On the RGB lines the ST transmits the brightnes of the current pixel in its red, green and blue components. After pulsing HSync the ST starts to transmit a new line of 620 or 340 pixels. These are the basics; ask your local TV-freak for details (ok?). When operating "normal" the ST is source of the sychronisation signals: the GLUE/Shifter chips decide when to start a new line/picture and tell the monitor so (via H/V-Sync). When programmed for external synchronisation, the Shifter (shifting out the pixels serially after HSync, hence the name) takes the sync lines as inputs and synchronizes his shifting (and thereforethe ST picture) to the external signal.

Now all you need are 2 VCRs with EURO AV (also called SCART) connector or any other [R+G+B+HSync+VSync+ground] input/output, a soldering iron, some wires, ST monitor plugs (about $3 around here in Germany) and a weekend: connect the VCRs and let one play (so it becomes SOURCE of a video (and synchronisation) signal) and the other one record (so it will synchronize on the input signals, you can use a monitor with RGB inputs here). If you now connect the RGB and Sync lines of the ST to the RGB and Sync lines of the VCR/Monitor *and* set the ST for external sync (how? hmm, its somewhere in the Abacus book "ST Internals" of Brueckmann/Englisch/Gerits, I think) and (voila!) the pictures are simply added (the brightness values for each pixel are added). To protect the ST you can do the connection over

one-Microfarad-capacitators (almost never necassary but cheap and
secure). That is all.

This "genlock" cannot do bluebox tricks, of course. It is just possible
to add the two pictures by synchronizing the ST to an external video
source (like a camera to put in titles or the like). A bluebox genlock
is a lot more difficult to make (and too much for my little knowledge..)
and more expensive...

Something wrong about this?
I don't think so; I tried it out: We connected two STs to the same
monitor, and programmed one for external sync.
They both ran NeoChrome with the same picture but slightly different
palettes. Looks great (and makes Amiga-Freaks run for shelter..:-).
Still something wrong? I'm not perfect... Correct me!

This can be found in Champions III, pages 8-22. Titled the "Champions Character Generator", it is indeed a series of charts that give the character various characteristics, disadvantages, powers, and skills depending on dice rolls. The charts use only material from Champions. Powers from C2 or C3 are not included. They recommend that if you may substitute powers and other abilities as you see fit.

I agree that this could be a "start" for character ideas, but in no way should it be considered an easy way to make good characters. As was pointed out in an earlier post, it can be used to point you in some new conception directions, and for that it works very well.

>
>Just curious, did you try contacting the dealer, or Atari? I have heard
>a lot of just out of warrantee stuff being replaced while in the vicinity
>of customer service.

my original mouse went bad on me at about 4 months... i noticed that it was "made in taiwan"... i ordered another through the mail from B&C on the west coast... it is "made in japan", and is much better made (i opened both of them up.) i also wrote to atari to complain, and they DID send me a replacement mouse (no questions asked), but it is also "made in taiwan", and has some of the same symptoms that my original mouse had before it failed (not moving the pointer the direction that you move the mouse!)

when i was in college, i took a statistics course, and, as with other courses, i learned much about the real world through the homework problems... one of them was about "memoryless" distributions, and what i "learned" from that problem was that solid state electronics have "memoryless" failure distributions, which means that if they don't fail within the first 90 days, they won't fail under normal conditions (statistically speaking, of course). i have always taken this as a comfortable justification for the 90 day warranties that we get in consumer electronics products, BUT...

there's more than solid state electronics in a hard disk drive... there are electromechanical mechanisms, not to mention the "industrial" abuse factor like IBM builds into their equipment (or used to)... you might be able to drop a PC on the floor and it would still work (not the hard disk, probably, though)... try that with an ST (I still love my ST!)

(and treat it gently)

3896. RAM disk and Magic Sac

Newsgroup: comp.sys.atari.st
Date: 1988-05-14 16:35:27 UTC
From: Updike@UMass.BITNET
Message-ID: <8805141232198DE.BDWZ@Mars.UCC.UMass.EDU>
Source record: 252397

I just wanted to start this letter by saying I love my Atari.
But on the serious side, I have two questions!
1. I am using the SI ramdisk. When I first created it I labeled
it "H". I now want to change it to "C". I have tried the configuration
program, but it doesn't seem to work. Any help would be appreciated.
2. I have been reading a great deal about Magic Sac, but does anyone
know what programs DON'T run on it?

Any help on these subjects would be greatly appreciated!

Damian Roskill
UPDIKE@UMASS

From: Roland_Henry_Pesch@cup.portal.com
Message-ID: <5424@cup.portal.com>
Source record: 252399

Sandra Loosemore (sandra@cs.utah.edu, sandra@utah-cs.uucp) asks:

>On the subject of clock chips, does anybody have recommendations for
>a clock chip that plugs into the cartridge port?
> [. . .] Is there anything
>better on the market?

I was long a satisfied user of Navarone Industries' "TimeKeeper" cartridge.
It plugs into the cartridge port, uses a battery in a removable holder,
and even has another cartridge port so that you can use other cartridges
piggybacked on it.

The DA it comes with can be used or not, at your option---it was fairly
decent, but eventually I switched to a freeware clock that was floating
around the local BB's.

The only reason I quit using my TimeKeeper is that I acquired a Magic Sac
cartridge, which as part of its Mac emulation has a clock... it's not
quite as good a clock as the one in the TimeKeeper, but the Magic Sac
does a number of other things for me too-- 8-) .

Can't give you Navarone's address; they've moved since I bought my
TimeKeeper. But I think they're in Mountain View, CA, somewhere.

Oh: I should mention that the first cartridge I had quit working mysteriously
after several months---maybe even a year, I forget. The people at Navarone
(At least the ones doing it then: this is when they were in Sonora CA)
were extremely helpful and rushed me a new cartridge immediately in
exchange for the bad one. As I recall, it was only some time after the
exchange that I realized the warranty period had actually expired when
this happened---Navarone never even brought up the issue. Good folk.

Howdy again...
Glad I missed that "standard compression scheme" flamer...
(on comp.sources.d a few days ago...?) Just thought I'd let you know that I've gotten the ARC sources I posted a while back to run on my Atari 1040ST, and plan to post executables to the ST binaries group sometime soon. Meanwhile, I've expunged a few more bugs from the version I posted before. (Thanks to John Gilmore for finding and fixing a particularly nasty one.)
I expect to post the final version of the sources to comp.sources.unix soon. It will support BSD 4.x and Sys V flavors of Unix, and still compiles on MSDOS, as well as running on ST TOS and MTS. Supports Phil Katz' Squashing, as before. I've gotten a good number of requests for the sources by mail - too many, in fact, and I've decided to neglect them in favor of a single posting.

By the way - John Gilmore: my mailer doesn't seem to have much success getting to you, though I seem to receive your mail Just Fine. How 'bout sending me your info on Thom Henderson, and I'll try to contact him. It'd be nice to resolve this last "bug" soon.

3901. RGB to composite video

Newsgroup: comp.sys.atari.st
Date: 1988-05-15 03:26:21 UTC
From: kevin@kjvw.UUCP
Message-ID: <238@kjvw.UUCP>
Source record: 252302
Cross-posted to: comp.sys.atari.st,sci.electronics

I have an Atari ST, which due to brain-damage, has only RGB monitor outputs.
I would like to be able to record animations generated with CAD3d, Aegis
Animator etc. for use with my VCR.

Does anyone have any ideas for building (or know where I can get) a board
which will convert RGB video to composite?.

Because of my "stone knives and bear skins" tool box, I am looking for
a minimum chip count, simplicity is secondary to expense.

Thanks

kevin@kjvw

See if you can isolate the problem to the computer or the monitor. If it is the monitor, it is very likely to be the flyback transformer, get it replaced. If the computer is the culprit, either a transformer or a coil is the most likely culprit but I couldn't begin to tell you how to isolate which one :-).

3904. Re: RAM disk and Magic Sac

Newsgroup: comp.sys.atari.st
Date: 1988-05-15 06:29:59 UTC
From: jdg@elmgate.UUCP
Message-ID: <930@elmgate.UUCP>
Source record: 252305

The magic sac is interesting... HOWEVER! Anybody seriously thinking
of using it, MUST! have a harddisk. Even w/ 2 DS floppy's The disk swaps
will drive ya nuts! This is no fault of the magic sac... Just the way
they grew the apple. I went through CONTORTIONS! getting the system 3.2/
FINDER 5.4 and Harddisk20 (the Hard disk driver for 64k mac roms (you know
the ones w/ the little gray hairs on em')) I thought great here we go!
My hard disk is STILL not working w/ it just blows up every time I tell
it there's a hard disk there!). Why? Got me? Anyone out there?
I've tried every combo I can think of, it just gets an illegal instruction
trap EVERYTIME! (too much gravity from the moon maybe? (hmmm...)).
The Mac IS NOT a "speedy" machine, Cutsie! yeah... I heard pagemaker 4.0
STILL has bugs in it (through I dunno how many revision's (certainly at least
4!) and still has bugs? (Fruit attracts bugs!)). In answer to your question
however... There are some fine programs that run w/ the SAC.. And, a good deal
of semi-respectable PD software available (NOTHING! like the PD on the IBM PC
however (tons of excellant stuff)... But, who wants good usable software at
a decent price!). As I understand it, even w/ the Magic translator (allowing
your ST to read write McFormated McDisks) copy protected Mac software does'nt
run. (bummer, as much of the real nice McStuff is protected). The translator
I'm told is VERY slow.. (Not that any Mac is gonna do 0-60 mph in 8 seconds).
In other words, it's meant to allow an individual to take McWork McHome &
back to work where the REAL mac is. Still.... some excellant programs
are available (Items like Ready Set Go which is lightyears ahead of
ST publishing stuff I've encountered).
Conclusions? Errr... W/ a WORKING harddisk, the $99 magic Sac is a fine buy.
And actually an incredable feat for Dave Small. There's just nothing like
seeing that little McFace staring at ya!. My compliments to Dave.
I digress...

My comments are my own... Yeah... dat's it... own...

RG!

Hmmm...Looks like the Atari ST section here has been getting (finally!) some messages. That's good. Too bad most of it pertains to nothing I know about! 8-)

Anyways, here comes a little advertising and a question. First the question.

Has anyone (else) reading this heard of Zmagazine and/or ST Report? It is a public domain electronic magazine (mostly Atari-oriented, although Zmag carries general computer news) that is distributed nationwide (as in across the USA and now in Sweden and Germany). I was just wondering if anyone out there is a regular reader, or has even heard of it. It has just started it's second year of weekly publication (100+ issues of Zmag; 30+ issues of ST Report) and is very popular. (Zmag is weekly; ST Report is

b
i-weekly.) If anyone is interested in it, it is available in CompuServe (it has its own file area), GEnie, Delphi, and (I think) The Source. You can download it from there or directly rom Zmagazine headquarters, the Syndicate BBS at 201-968-8148 (3/1200, running Carina II BBS).

Now for the advertising...

WANTED: Callers for The Graphics Dump BBS, 201-469-0049, to participate in the Atari section. I have been made co-sysop of that section and things (read: message activity) has been dwindling. There are files for 8-bit and ST alike, and is accessable via PC Pursuit (NJNEW). It runs 24 hours a day, 7 days a week and runs at 3/12/2400 baud. Call, ok? Good.

----------"If there's anything more important that my ego around, I want it caught and shot now." -Zaphod Beeblebrox

Origin: Right here, in my bedroom, at about 2pm on a nice day.
Read: By everyone and his brother.
Why: Because.

Excuse me if I'm wrong - but isnt it true that you have used an argument - ie. the program name ? In fact I just tried it on two of our Un*x boxes and this is indeed the case - argc should be >=1 argv[0] should be the program name (I know it isnt on the ST),and argv[1]..argv[--argc] contains the arguments.

Mouse jumping has nothing to do with the emulation. I'm working
with a real Mac SE (sometimes :-) and observed the mouse cursor jumping
all the time there. The (illegal?) software emulator I have seen once works
at least as fast as a real Mac SE (faster than an old Mac). I've never
seen Magic Sac, though. Anyhow, you cannot expect smooth mouse movement
from any true Mac emulator, since the mouse movement is controlled by
Apple's software there. BTW, although I have to switch between ST and Mac
from home to work, I prefer my ST software, and would never like to run
a Mac emulator.

I like them both but I don't use either. Could someone tell me if either can accept a monochrome ST using a 50-line screen definition? Or do the programs have to be patched? I'll use the first, MORE or LESS ;-), that does it. Oher programs such as UniTerm accept 50-line screens. I'd appreciate also if HDSCAN would accept a 50-line screen -- but maybe the Pro. version does. Thanks in advance + reply directly because I can't get the newsgroups.

<
< /*
< ** What, you wanted something funny?
< ** --- Anthony Lapadula
< ** (That's ...!unh!al671 to you!)
< */

My 1040 ST has started doing the same thing recently. Not all the time -
sometimes it will start whining after an hour or so of operation, sometimes
it doesn't start at all.

I at first though it was the monitor, since the the whine often coincides
with black background on the screen (as when running PC-Ditto). But
sometimes it starts up when the modem hangs up. Weird.

I am now sure that it is not the monitor, even though it sounds like a
typical monitor whine. The proof of this is that it stops when the monitor
is off.

Anthony is right, it is very annoying. Blaming the power supply makes some
sense - a resistor and capacitor are probably forming some type of R/C
resonant circuit. Replacing the filter capacitor would probably help.

I know enough electronic theory to come up with the above explanation,
but not enough to know what to change. Is there an EE out there who can
help?

3916. Re: RAM disk and Magic Sac (Really: Sac & HD20)

Newsgroup: comp.sys.atari.st
Date: 1988-05-16 14:31:54 UTC
From: tim@brspyr1.BRS.Com
Message-ID: <3526@brspyr1.BRS.Com>
Source record: 252317

From article <930@elmgate.UUCP>, by jdg@elmgate.UUCP (Jeff Gortatowsky):
|
| The magic sac is interesting... HOWEVER! Anybody seriously thinking
| of using it, MUST! have a harddisk. Even w/ 2 DS floppy's The disk swaps
| will drive ya nuts! This is no fault of the magic sac... Just the way
| they grew the apple. I went through CONTORTIONS! getting the system 3.2/
| FINDER 5.4 and Harddisk20 (the Hard disk driver for 64k mac roms (you know
| the ones w/ the little gray hairs on em')) I thought great here we go!
| My hard disk is STILL not working w/ it just blows up every time I tell
| it there's a hard disk there!). Why? Got me? Anyone out there?
| I've tried every combo I can think of, it just gets an illegal instruction
| trap EVERYTIME! (too much gravity from the moon maybe? (hmmm...)).

I just went through the same thing. What I did was went back and went through the steps outlined in the notes for Release 5.9 (you are using this release, aren't you???). You must follow the rules EXACTLY -- TO THE LETTER.

In my first attempt, I formatted an MFS and an HFS partition as instructed. Then booted with HD enabled from a floppy w/o HD20. I then copied the System Folder from the boot floppy to the MFS, then HD20 from another floppy to the MFS partition. *** BAD MOVE *** It seems that copying the file "System" from the boot floppy tries to make the MFS partition bootable, which really messes it up. As far as I can tell, everything for the system folder MUST be copied from another disk (not the one used to boot in Mac mode).

Be sure to use Finder 5.3 --- Using Finder 5.4 on the MFS partition really causes some wierdness. You must use 5.3 on the MFS boot partition, but you can put 5.4 on the HFS partition, which is the one that will eventually be used anyway.

I still get crashes every now and then, but the above findings eliminated a lot of them.

If anyone finds anything more, please post or email to me!

[Has anyone read the notes from Data Pacific on GEnie regarding use of the harddisk? I haven't looked there yet, but I remember reading somewhere that there was something there.]

> Conclusions? Errr... W/ a WORKING harddisk, the $99 magic Sac is a fine buy.
> And actually an incredable feat for Dave Small. There's just nothing like
> seeing that little McFace staring at ya!. My compliments to Dave.

Actually, I found it pretty good even with floppy disks. I have 1 meg of memory (I would not recommend less), and use RamDisk+ to create a 350K RAM Disk -- then copy whatever I want to run that session there. It

also allows for copying of the System/Finder stuff and running from there,
but you need HFS installed for that (which leaves out floppy-only systems :-(

Anything that needs the 128K ROMs *will not work*. This includes neat things
like HyperCard, which I think is one of the things Magic Hackers really
want. But there is still a lot of good stuff that does work.

I had a similar problem with my 520/1-Meg^ and Supra. I first thought it was my DMA extension cable (3 feet long), but when I hooked it up to a friend's system, it worked perfectly. (The test I used was rapid accesses to the HD by reading, displaying, and writing picture files.)

The problem was a marginal DMA chip. $35 for a new one cured my problem and I haven't had any trouble since.

From: uace0@uhnix2.uh.edu
Message-ID: <586@uhnix2.uh.edu>
Source record: 252320

Actually, the only problem for the Megas is with the Mega 4. Since the ST can only address up to 4 meg, if you try to access above that, you get a bomb. On a Mega 2, you are not breaking that limit, so you can safely test above 2 meg and not get a bomb. The simple test for exactly 4 meg is the proper solution.

3922. 16MHz board -- fast CPU, slow memory?

Newsgroup: comp.sys.atari.st
Date: 1988-05-16 18:56:05 UTC
From: paul@cacilj.UUCP
Message-ID: <725@cacilj.UUCP>
Source record: 252323

My question concerning the "fast" board is this: How much faster will memory references be? It seems to me that the memory on the ST right now has around a 120ns access time, just about right for one memory reference every 8MHz clock cycle. So even if you run the CPU at 16MHz, the memory STILL takes 120ns which now throws the processor into a wait state (or more?). Net gains on memory accesses: 0. (Is my logic correct?)

Question two: would it be possible to replace the memory with faster chips to eliminate or reduce the number of wait states? Otherwise memory won't be faster, I/O won't be faster -- what do you actually gain?

3923. Magic Sac and Hard Drive

Newsgroup: comp.sys.atari.st
Date: 1988-05-16 19:30:01 UTC
From: manis@faculty.cs.ubc.ca
Message-ID: <2603@ubc-cs.UUCP>
Source record: 252324

Jeff Gortakowsky mentioned that he'd had trouble installing a hard disk system under Magic Sac. So did I; I called Data Pacific, and they advised me that you have to go through a longwinded process to install it. The basic problem is that Apple's HD20 driver assumes there's a system on a hard disk, if it's connected. Apple disks (and compatibles) all come with a system folder; Atari drives don't (some trivial licencing problem :-).

What you have to do is to create a tiny little partition (1MB or so) formatted with the Mac (flat) file system. Copy your system to that (using a floppy system disk with no HD20 driver on it). Then reboot with another disk *with* HD20, copy that system to your real partition, and you're away. This is a dumb way of doing it, but blame Apple, not David Small.

This is not as useful as one might hope. If you put a Grey title on the screen then you will be able to see 'through' it because the background is changing. It would be useful if the source VCR just played a black screen so that you could record the Atari's output on the VCR.

>They both ran NeoChrome with the same picture but slightly different

From: ss6349@leah.Albany.Edu
Message-ID: <799@leah.Albany.Edu>
Source record: 252327

Hello,

Does anyone out there in netland have a track copier for that atari st, that does not care if there is a bad sector? I would like it to read the sector and still write it out, even if there are errors. Is this possible? If no-one has done it, would it be easy to do in C? Or Pascal? I have a disk that has a munged track, and even though it is munged it works fine. I would like to make another copy of it, so that I can play with it. without worrying about it losing anything...

>-- Phil Paone

Phil, you are confused. This is UNIX's method. Unix never gives you an
argc < 1, since you always have the name of your program in argv[0].
On the ST they stick some fake name in argv[0]. (I patched mine so it
always says "stupidity".

Go back and unpatch your library!

You know, I really hate the fact that argv[0] isn't initialized intelligently!
If I get annoyed enough I'll come up with some not quite portable way of
getting at the program name, and patch it into my prolog code.

3928. Atari ST RAM DISK

Newsgroup: comp.sys.atari.st
Date: 1988-05-17 01:25:07 UTC
From: Robert_Lisowski@rubbs1.UUCP
Message-ID: <43.228FDE31@rubbs1.UUCP>
Source record: 252329

Have you tried clicking once on the drive and going up to the options menu to choose "Install Disk Drive"? If you do that, you can change the letter & the name of the drive and install it. Then you have to delete the old drive from the desktop using the same sequence. Be sure to save the desktop after doing this. This works for my ram disk as long as I define the new drive with the new letter in the ram disk installation software too.

Source record: 252330

Another reply to Sandra Loosemore's request about ST cartridge clocks...While I haven't had the time/money to invest in one (my car recently underwent a $2000 engine rebuild), I do know of someone who has a really neat ST clock -- I forget who makes it and what it's really called, but I like to call it the "Invisible Clock" for reasons given below...

The clock isn't a cartridge. It is a piggyback socket that you plug into your ST. To install it, you just open up your ST, remove one of the socketed chips, plug this clock into it, replace the chip on top of the clock (no soldering; the clock looks like a "fat" socket), and plug in any 9-volt battery. (I strongly suggest insulating the battery with a few strips of electrical tape -- just in case.) That's it! If your computer ever needs servicing, you can just unplug the clock and nobody will ever kno

w you opened up your ST.
Setting the clock is a snap -- it's set via the Control Panel! No extra desk accessories, no extra program, no RAM eaten up!

I want one.
-STeve

"Where," said Ford Prefect quietly, "does it say teleport?"
"Well, just over here in fact," said Arthur, pointing at a dark control box in the rear of the cabin. "Just under the word 'emergency',above the word 'system' and beside the sign saying 'out of order'."

-Conversation between Arthur Dent and Ford Prefect on their way towards a very large, hot sun with no control over their ship.

3930. I Want Some Whine!

Newsgroup: comp.sys.atari.st

I hear a lot of talk about this "ST whine," yet (call it ignorance) I still have no solid idea or what you guys are talking about. SO...

My "whining" experience only occurs when I turn on my SC1224 (color) monitor. When I turn on the ST, fine - no sweat. When I turn on the Avatex, fine - no sweat (well, almost -- the cordless phone picks up a slight amount of static). Then when I turn on the monitor...Wheeeeeeeeeeeeeeeeeeeeeeeeeee!!!!!! You can hear this high frequency pitch coming out of the monitor. At first, it gets on your nerves but after a few minutes of sitting in front of it you kinda "mask it out" and don't hear it any more. I

suspect this is the cause for the occasional line noise (ok, CONTINUOUS line noise) that I get when I call a couple of BBS's (I only get noise from three local BBS's; all others are crystal clear). I have a shielded homemade modem cable, so there shouldn't be any problem there, right?

Anyway, what I want to know is this: Is there a chance that the line noise I get (I don't get noise when I call here) comes from the whine in the monitor? Can I get rid of that whine without voiding my warrantee or encasing my monitor in shielded casing? If so, how?

-STeve

"Ford!" Arthur said, "there's an infinite number of monkeys outside who want to talk to us about this script for Hamlet they've worked out."

3931. Publisher ST - Deserving of accolades

Newsgroup: comp.sys.atari.st
Date: 1988-05-17 03:38:03 UTC
From: parora@gpu.utcs.toronto.edu
Message-ID: <1988May16.233803.18783@gpu.utcs.toronto.edu>
Source record: 252332

PREAMBLE:

I bought Publisher ST from Timeworks on Saturday despite my reservations about Timeworks. I had bought DataManager ST some time back and I thought that that purchase was wasted. THAT program needs a lot more capabilities in my opinion before it can be useful to me (and I don't consider my data management requirements to be very extensive). Happily this isn't the case with Publisher. Before I go any further let me state the following caveat: I haven't used Publishing Partner {Professional}, Fleet Street, or Calamus. Readers should perhaps look for comparisons before commiting. That formality dispensed with, let me continue raving about Publisher. I really like this program! It is easy to use, powerful (enough for me) and really well thought out.

****
Reqirements: 520ST, 1040ST, Mega ST2, ST4
One or two SS floppy drive. ; A real plus. It essentially
One or two DS floppy drive. ; works with any hardware
A Harddrive (+ floppy to ; combination. (refer to NOTES
install the software) ; below.

Colour
or
Monochrome monitor

Printers Supported:
1. Atari SLM 804 laser printer.
2. Any PostScript compatible printer.
3. HP LaserJet II/Plus or compatible.
(Requires 1M for 300x300 dpi resolution)
4. Epson 9 pin {compatibles}.
5. Epson 24 pin {compatibles}.
6. Okidata Laserline 6.
(Requires 512K)
7. NEC P6 or P7.

NOTES: Using a 520ST with 0.5M will limit the # of font sizes somewhat.

There was some comment in the manual about how the Atari
SLM 804 lazer printer can be used only with the MEGA STs.

**File and feature compatible with Publish It! for the PCs which
I understand costs twice as much (??).

IMPORT FROM: 1. WordPerfect
2. 1st Word
3. WordWriter

4. ASCII

Generally a limited import with few attributes being
transferred.

1. GEM Paint
2. EZ Draw
3. NEOChrome
4. DEGAS (will not import compressed files just .PI*)

MY CONFIGURATION:
1. Stock 1040STf.
2. One DS floppy.
3. Roland PR-1012 (Epson RX compatible. 9 pin).

PRICE: Selling for about $85 dollars US through MO firms.
It is selling for $140 up here in Canada but I found it for
$90 (Torontonians check out Smart Screens at York and King).
****

Installation was very painless. A simple dialog box prompts you for your
printer and disk drive set up and then works away until the software is
installed. Reasonable status messages and queries are presented along the
way.

FEATURES:
I always find this the hardest to write about since I am trying
to condense the manual somewhat:

Lots of fonts (6 styles with many sizes available). Many different
types of bullets are also offered.

Frames can hold STORIES, LINE ART, IMAGES i.e. text, object oriented
drawings and bit mapped graphics.

Standard DTP features include text flow around frames, hyphenation,
text flow through linked frames.

The basic steps to developing a document is to use your favourite
WP and import this as a story. Images/drawings are imported similarly
and all of these elements constitute your LIBRARY.

Set up your page layout using frames. Frames are invisible layout
boxes into which elements of your library are 'poured'. i.e. these
are the columns in newspapers.

Elements of the library are poured into frames. Frames may be linked
together so that long 'stories' can be larger than a single frame.
Frames on different pages can be linked together. Textflow is
handled automatically.

Basic units of stories are PARAGRAPHS. These are tagged with a
style such as HEADING, BULLET, BODY TEXT, etc. There are reasonable
predefined tag styles and you are allowed to define your own. In

addition, blocks of text may be tagged independent of the paragraph. NOTE: When importing text, Publisher requires TWO C/R's in order to recognize a paragraph rather than the traditional ONE. This can pose some import problems.

Nice graphic capabilites, including simple line drawing capabilites (circles, ellipses, rectangles, rounded rectangles) and a bit editor. Picture cropping, changing aspect ratios are some of the other features included.

IMPRESSIONS:

A nice clean interface. Intelligent use of icons. These enhance functionality rather then just being cute. A lot of thought went in here. I was up and running in less than 1/2 hr.

Impressive array of features. Logical, and common sense usage. Again, this makes the power available to you quickly.

BEEFS: (All minor)

Installation is for one hardware configuration only (including printer). If you are using multiple printers there are ways around this, but they aren't always clean (i.e. install the program on different hard drive partitions with different parameters).

Text cannot be rotated. Although you are allowed landscape or portrait layouts, text is horizontal only.

No spline (smooth) feature for line drawings. Could someone tell me if this is not possible or not wanted? I find this an essential feature and got addicted to it using MacDraw. I don't find it in EZDraw either.

Automatic kerning (space between characters). Although kerning capabilities are incorporated, there is no auto kerning.

Overall, I really, really like this program. The more I use it the more I think "Wow, is this an intelligent design". I recommend HIGHLY, but as I stated at the offset I haven't had any experience with other DTPs so comparison would be beneficial.

3934. Redirection

Newsgroup: comp.sys.atari.st
Date: 1988-05-17 09:56:15 UTC
From: leo@philmds.UUCP
Message-ID: <483@philmds.UUCP>
Source record: 252335

Has anybody of you had any experience with redirection? I'm trying to start up a child process from a parent that has redirected input and/or output file descriptors. After much fiddling with Fdup, Fclose, Fopen and Fforce I managed to get the parent opened a file and the child writing to its stdout being this file (using Cconws, or gemdos 0x9). However, when I used the standard library routines coming with my compiler (Lattice-C that is), such as puts() and printf() the child is bombed (Bus Error). Who knows the correct way to achieve redirection (that is, going from parent to child process, I know how to use Fforce for in-process redirection) ?
Please answer by e-mail; if there are others also interested in a solution you can mail to me too; I will forward the results to this group if there's enough response. Maybe I have to figure out things myself after all ...

Leo. (<problem >solution).

>
> What excatly does this package do (windows on Unix(tm)) obviously
> but what terminals (explicitly does it support charcater based terminals)
> does it support & what version(s) of UNIX does it run in

Near as I can tell, the terminals supported is built into the client (ie, the ST or MAC end of the uw connection), not the server.

For expample, the latest MAC version supports ADM31, ANSI, TEK4014 (or close), and a couple others, while the latest ST version supports only the ADM31.

The server end (which will only run under BSD 4.2 or greater Unix, since it requires sockets), manages the output from several processes, multiplexes this output so that the client knows which window to output it to. It acts as a kind of director for the output of all of its child processes. Up to seven windows can be active at once.

The latest MAC version of UW supports a few nifty things that the ST version does not -- it gives the server end more control over the windows, allowing for titling, resizing, etc, at the program end.

For a copy of the Unix end, it was posted to comp.sources.mac a month or so ago. Check a local archive to see if anyone nearby saved it.

3947. Megamax v1.1 bug

Newsgroup: comp.sys.atari.st
Date: 1988-05-18 01:38:46 UTC
From: newman@dasys1.UUCP
Message-ID: <4482@dasys1.UUCP>
Source record: 252348

The following is a very simple program that exhibits a very nasty bug in
Megamax C v1.1. Compiling this program CRASHES THE COMPILER AND CORRUPTS
THE OBJECT FILE!! (two bombs appear).

```
main ()
{
struct x y;
int i;

for (i = 0; i < 1000; i++) ;
}
```

The problem seems to be referencing the undefined structure tag. I don't
know if this bug still exists in Laser C, anyone care to check? Any comments
from Megamax?

From: saj@chinet.UUCP
Message-ID: <5607@chinet.UUCP>
Source record: 252252

Paul Close correctly observed that if you speed up the cpu to 16 MHz but keep the 120 ns memory you'll introduce wait states. But a very rough estimate is that 68000 code has a memory reference about every 3 cycles (that's both operand and instruction references). The big problem is with video refresh, which is all memory references. But the compute part of operation should suffer relatively little from wait states.

3952. firstword plus & pictures formats

Newsgroup: comp.sys.atari.st
Date: 1988-05-18 16:12:39 UTC
From: nowlin@ihuxy.ATT.COM
Message-ID: <2535@ihuxy.ATT.COM>
Source record: 252254

I own neochrome 1.0 but I have several PD programs to manipulate picture files in .NEO, .PI? and .TNY formats. I recently purchased firstword plus and really like it as a word processor. I'm especially happy with the built-in spelling checker. One of the main reasons I selected it, aside from the fact that it's compatible with my existing firstword documents, is that it can import and print pictures along with text. It does a real nice job considering I have a nine-pin dot matrix printer.

Well, it turns out that it can only import .IMG files. I have no utility to convert .NEO files to .IMG files. There was a desk accessory called snapshot included with firstword plus that can grab part of a screen and create a .IMG file but when NEO is running none of the installed desk accessories are available. That makes it hard to grab parts of .NEO pictures. Has anyone else solved this problem yet? Are there other painting or drawing programs out there that generate .IMG files and can use .NEO files? Any help would be greatly appreciated. Thanks.

3953. Re: 16MHz board -- fast CPU, slow memory?

Newsgroup: comp.sys.atari.st
Date: 1988-05-18 16:25:25 UTC
From: rwa@auvax.UUCP
Message-ID: <641@auvax.UUCP>
Source record: 252255

Paul Close wonders (use `p' to read parent article) if a 16 MHz cpu running on the current ST motherboard would be an improvement. My answer is Yes. Of course I/O and memory accesses can't be improved due to the timing and other restrictions of the design. But many, many instructions of the MC68000 repetoire uses cycles for things other than memory access; for instance, division and multiplication times are almost completely CPU-clock-speed dependant rather than memory-speed dependant. On the whole, one might not (will not) get a two-to-one speed up, but for math-intensive applications such as ray-tracing you will notice the improvement.

It seems to me that something is grong with the emulation of vtxxx terminals.

If I send the string ESC[?3l the screened will be set to the 80 column mode
and the screen will be erased.
The screen will be erased even if originaly was in 80 column mode.

I would assume that if the screen was in 80 columns mode already the command
would have no effect (screen would not be erased).

Is this the normal way vtxxx work?
- If no could Simon please correct it?
- If yes could we have a string which would behave as I described?

Thanks,

Thanasis

I currently use EpStart from SoftStyle -- they deliver a MagicSac version on disk in Magic format. It only works with Epson and compatible printers though (I use Panasonic 1091 with no problems).

I know there is at least one other printer driver available in Magic format, but don't know the name, quality, or any details.

3956. MEGABYTE 16Mhz board for the ST

Newsgroup: comp.sys.atari.st
Date: 1988-05-18 20:35:30 UTC
From: keithr@vice.TEK.COM
Message-ID: <2537@vice.TEK.COM>
Source record: 252258

I for one have been wondering what the hold up has been on the 16Mhz board for the ST has been, so I called MEGABYTE today to get the scoop. They said that they will be shipping the board to dealers in 2 weeks which will include the 68000-16. The price has gone up a bit. They quoted me $249 which doesn't include installation.

I guess we'll be hearing more in about 2 weeks. Stay tuned...

In the beginning (pre-Tramiel), Atari practically alienated third-party developers, leaving them out of CES/Comdex booths, software catalogs (published by Atari), and not even mentioning them in their documentation. Now, in the Tramiel Atari, they are relying too much on third-party developers. Yes, they are included in the CES/Comdex booths, software catalogs, etc, but Atari itself is not producing as much as it could/should. Look at the hard disk -- ICD and Supra had ST hard drives prototypes out befo

r
e Atari did, and Supra had a ready-to-go, marketable version available to the public about 6 months before Atari did. CD-ROM has been available for Apples and IBM's for a few months now (granted, at a higher price, but what can you expect from a bare-bones Apple/IBM computer? Bargains?) and is now just showing up on the ST scene. The same thing applies to the SLM804 laser printer, the Megas, and everything else. Basically, it seems to me that Atari is saying, "OK, we made this ass-kicking computer, now

l
et's sit back, maybe slap a few improvements onto it, and see what the rest of the world puts into our wonder machine."

I have heard rumors that programs such as CAD-3D and VIP Professional were going to be marketed through Atari Corp itself, which would have greatly improved revenue and reputations for Atari (being known as the producer of top-selling software is VERY profitable). Again, this is just a rumor, but the Tramiels have made mistakes in the past. (Ie, Jack says "Hey, let's use TV to promote our C=64," which was a great success. Then he gets Atari and says, "TV? Nah, that won't work for our computers." Now lo

o
k at the sales increase for the Atari games systems after TV ads came out. I have seen an Atari 130XE commercial ONCE on channel 2. Wow. Thrilling. I'm sure that gave everyone the urge to go buy one.)

Source record: 252260

The chances of an Amiga running ST software is about as remote as seeing a sperm whale climb up Mt Everest and announcing that McDonalds hamburgers are cheap substitutes for floor wax.

Why? First, the programming invloved would be too extensive, taking up at least 400K-500K, which for many Amiga owners would render the "ST Emulator" worthless, since all they have is 512K. Next, the speed of the emulator would be about nil, since an Atari 1040ST running at a full 8Mhz can emulate a wimpy 6502 Atari 8-bit at about .5Mhz. Since the Amiga is almost a full point slower than the ST (8Mhz for the ST compared to 7.16Mhz on the Amiga), the Amiga would process at about .00001Mhz running ST soft

w
are. Third, since most games (since that's what you'd be running, so you say) run in ST low resolution, which is half the resolution of the Amiga screen both vertically and horizontally. Thus, for each refresh cycle of the screen, the Amiga would have to color in FOUR pixels to match ONE ST pixel, slowing down the Amiga even more.

If you think I'm putting down the Amiga, you're basically right. Being an ST owner and avid Atarian since '79, I can give you many reasons why the Amiga can't stand up to the ST, but I don't want to start a war and I'm sure you have the maturity not to start one either.

More vaporware for the Amiga will be announced shortly.

-STeve

PS: Why do you think the ST can emulate a Mac and the Amiga can't?

3959. Bug in MWC 3.0 -VPEEP

Newsgroup: comp.sys.atari.st

The following C code shows up a bug in MWC V3.0.6 when using the
-VPEEP option.

typedef struct _list { int value; struct _list *next; } LIST;
.....
register LIST *p, *q;

q = p;
p = p->next;
if(p)
p = q;
---------
p is a5 q is a4

No -VPEEP -VPEEP

movea.l a5, a4 movea.l a5, a4
movea.l 2(a5), a5 movea.l 2(a5), a5
move.l a5, -4(a6) move.l a5, -4(a6) <--This line not eliminated
move.l -4(a6), d0 move.l a4, d0 <---SHOULD BE move.l a5,d0
beq.s L1 beq.s L1
movea.l a4, a5 movea.l a4, a5
L1: L1:
----------
the sequence
move.l a5, -4(a6)
move.l -4(a6),d0
should be peephole optimized to
move.l a5,d0

In the cases when correct code is generated, it still does not remove
the first extraneous move.l a5,-4(a6) instruction.

The upgrade is defintly worth it. Csd is really worth it. BTW GULAM
users may have noticed that Csd looks at the PATH environment variable.
If your PATH does not have `.' in it, Csd does not find the executable
program (if it is in the current directory), and exits with error
code -33 (file not found). If PATH has `.' in it, CSD works great.
```

3960. Re: 16MHz board -- fast CPU, slow memory?

Newsgroup: comp.sys.atari.st
Date: 1988-05-19 00:34:54 UTC
From: gert@prls.UUCP
Message-ID: <11652@prls.UUCP>
Source record: 252262

According to some local statistics of 68000's in operation, a crude approximation is that a 68000 spends approximately half of its cycles internal and half externally (due to memory reference statistics). The external cycles still take the same amount of time, the internal cycles go twice as fast. Hence, what used to take 'n' seconds, now takes '0.75*n' seconds. Or at most a performance of 1.33 * that of an ST with a 8 MHz processor.

Add to this the fact that there is an increased number of memory requests per time unit, and hence more collisions with the video accesses (if this applies on the ST, I'm not sure). This would lower the performance a little more.

So you get somehwere between a 1.2 to 1.33 * speedup, roughly.
I wouldn't consider that enough of a speedup in relation to the expected cost.

I've just had a reply to my letter to Cumana, in which I explained to them the error of their ways, and told them how I'd fixed my drive. Aside from rather profuse thanks, the letter included several bits of information I thought I might pass on --

1) The fix I outlined is apparently appropriate ('elegant in its simplicity')

2) They will be contacting the people who *they* sold this series drives to, telling them how to fix it themselves or to return it for modification. I suspect that this means the *distributors*. Cumana themselves don't seem to require you to send back a registration card, so are unlikely to know who the final owners are. So, unless you bought directly from Cumana, you may have to look up your dealer.

3) The problem relates to a specific variety of Chinon drive mechanism. I infer from this that it may well affect drives 'made' by other makers than Cumana, if they have used the same series Chinon drive. (The 'problem', of course, being that the mech in question is too sophisticated for the ST's way of working -- creeping featurism -- and so needs one of its features nobbled.)

4) They had noticed the problem by the time my letter arrived, but had not yet solved it. They have modified their production procedures so that the problem will not occur in Cumana drives made since they noticed the problem. (They had suspended production pending working out a solution.) Chinon now know about the problem and the solution, so I assume that other makers using Chinon mechs will also be getting their act together, but don't know for sure.

3962. Arcade Games for High Res Monitor

Newsgroup: comp.sys.atari.st
Date: 1988-05-19 10:55:40 UTC

Message-ID: <507@dcl-csvax.comp.lancs.ac.uk>
Source record: 252264

Okay folks I have a little request. I have got a little fed-up trying to find the odd arcade game that will run on a hi-res monitor.

So can any of you out there give me some information, plus a rating &c. None of the mags in this country gives the necessary info. Frequently neither does the packaging.

This seems particularly studip to me as Atari claimed somewhere that most of their european users had hi-res rather than colour.

Anyway mail me the info and i'll summarise if others want to see it. Myself I just want something to do when my mind won't handle the thesis anymore.

3963. Re: 16MHz board -- fast CPU, slow memory?

Newsgroup: comp.sys.atari.st
Date: 1988-05-19 10:57:22 UTC
From: pes@ux63.bath.ac.uk
Message-ID: <2559@bath63.ux63.bath.ac.uk>
Source record: 252265

The effect of a faster-clocked 68000 would be non-trivial to determine, and would depend to a great extent on what (precisely) the program is doing -- in particular, how much of what it is doing is in the registers.

Even in the worst case, the 68000 cannot hit memory every clock cycle. I believe that the best you can get out of it (or worst, depending on point of view), if you write a program designed to hit memory as often as possible, is one memory reference every two cycles. More typical programs should make even fewer memory references.

On the other hand, this fact is already used to advantage. In the ST, the memory management chip actually GUARANTEES alternate clock (memory) cycles to the Video Shifter. The Video Shifter ALWAYS wins.

Because most 68000 instructions take even numbers of cycles to do things, typical (or 'normal') operation is that the Video Shifter gets all the even clock cycles, and the CPU gets to reference memory only during odd clock cycles. Usually both the Shifter and the CPU are happy with this arrangement, because the Shifter is getting all the memory refs it needs, and the CPU is being allowed to look at memory as often as it can actually cope with. Since some 68000 instructions may use odd numbers of cycles, and since the CPU and the Shifter are not tightly synchronized, they may occasionally fall into step. In this case, the 68000 is WAITed (the Shifter ALWAYS wins) to get them back onto alternate memory reference cycles again.

So, a faster-clocked 68000 wouold gain you NOTHING AT ALL during sequences of instructions which require maximum rate (every 2 clock cycles) memory references -- it would just spend more time being WAITed. On the other hand, it could go a lot faster when doing things which don't have to hit memory -- like multiply and divide which first come to mind.

The net effect, then, is fairly unpredictable, depends on the precise nature of the program.

3964. Re: 16MHz board -- fast CPU, slow memory?

Newsgroup: comp.sys.atari.st
Date: 1988-05-19 11:04:09 UTC
From: pes@ux63.bath.ac.uk
Message-ID: <2560@bath63.ux63.bath.ac.uk>
Source record: 252266

By the way, to anticipate the obvious next question, when the DMA is active, it steals memory cycles from the CPU (68000). The operant principle (as I keep saying) is 'the Video Shifter *ALWAYS* wins'.

3965. Re: clocks for the cartridge port

Newsgroup: comp.sys.atari.st

From: jpdres13@usl-pc.UUCP
Message-ID: <1329@usl-pc.UUCP>
Source record: 252267

I own a Logikron Clock Card and it is one of the types that supposedly cannot be opened for battery change. This is not true. Logikron had two types of cards which looked very similiar, the first models were sealed and could not be gotten into, and the second model came out as a response to some griping. The second type can be opened with a small standard screwdriver, the battery is then easy to change. This was a little shocking to find, because even the manual that came with the product mentioned that the battteries could not be changed, and the cartridge should be sent back to the factory in 4 or 5 years to be fixed. I think that the manual was never updated to the new cartridge.

A friend of mine has the Navarrone "Time-Keeper" cartridge, it has a slot on the outside of it to allow you to still put things in the cartridge slot of your ST even though you have the clock cartridge in. After the time is read from the cartridge, it disconnects itself and runs the lines straight out of the back of the cartridge to the next cartridge. I spotted this one in an ST magazine (Atari Explorer 2 mos ago I think) for $20 from a mail order company.

From: cyliax@ea.ecn.purdue.edu
Message-ID: <3140@ea.ecn.purdue.edu>
Source record: 252270

Hi,

I need some information on gdos. I have an application that uses gdos for output to printers. What I would like to have is enough info to be able to configure gdos and write new device drivers. I'm particularly interested in writing a driver that will take advantage of my new 24-pin printer, as well as being able to write the output to a file in some graphics "standard" like PostScript or UNIX plot. Also if anyone already has drivers for the following, I would be interested in obtaining it.

Star NB24-10 (emulates one of the 24-pin epsons)
HP plotters (any one would do, would have to write to a file)
PostScript (would have to write to a file)
Unix Plot or pic (would have to write to a file)

If I can get the information, I would be interested in writing a few of the above drivers.
Thanks,
--

With out real file locking you would have to use lock files to control
access. I could easily add the code to GEMDOS to lock files down to the
byte but "is it reallyxD worth it?" Maybe on the next release I will add
file locking when a file is opened for W or R/W but i think it will cause
more problems that it's worth. As for the physical connection you can use
the MIDI or AUX port for the network.

Well, not exactly. Remember - a good chunk of that 8Mhz on your Atari is
usurped for video control and refresh as well as floppy disk I/O - the
Amiga has extra support hardware to offload it's 68000 from doing this.

>ware. Third, since most games (since that's what you'd be running, so you say)

Not really guy - the Amiga has a very flexible display architecture, it
can even stoop down to the Atari's "low resolution" mode (320x200) - 'cept
it can do it in 32 colors at a time and more with some tricks. Even if it
were in 640x200 mode, the Amiga would shove display bits around faster than
the ST thanks again to it's custom video co-processor.

>If you think I'm putting down the Amiga, you're basically right. Being an ST
>owner and avid Atarian since '79, I can give you many reasons why the Amiga

>have the maturity not to start one either.

Wrong - you *do* want to start a war, otherwise you wouldn't have said
that you were putting the Amiga down. If the ST is so great, why do you
find it necessary to put the Amiga down in public so? I'd really recommend
you learn something about the Amiga before continuing any further (hey,
like read the manuals - you can find them in any B Daltons).

>More vaporware for the Amiga will be announced shortly.
>
> -STeve

Betcha I can name more ST vaporware products than you can name Amiga vaporware products ;-)

>PS: Why do you think the ST can emulate a Mac and the Amiga can't?

Why don't you read David Small's recent message in Comp.sys.amiga and find out. Oh, you mean you don't already read that group? Sounds like you're not very informed then about what's going on in the Amiga community - I make it a point to read this ST group as well as ST oriented magazines so *I* know what the ST is all about.

Hey - since you're on rubbs why don't you stop by the JAUG (Jersey Amiga User's Group) meeting at the Rutgers Physics Auditorium tommorrow evening (Friday, May 20th, 7:30 P.M.) and see some of the neat things an Amiga can do. We're gonna have the Amiga User Group premiere of a fully interactive 3D editing and animation system called Caligari - it may open your eyes a bit.

Cheers,
Eric

Who is going to attend Usenix?
There will be a talk on Friday, June 24 during the 2-3:30 session
in the continental ballroom on:

"A Low Cost Bitmapped Terminal On The Atari ST"
Given by Peter Collinson, University of Kent, Caterbury (sic?)

Will anyone be willing to send a copy of this (or a review) to this
newsgroup? Peter, are you reading this, and willing to send the text
to us after you give the talk?

Thanks.

3974. Oki, Ricoh hit with suit over LL-6 defects

Newsgroup: comp.sys.atari.st
Date: 1988-05-19 21:03:10 UTC
From: papa@pollux.usc.edu
Message-ID: <9212@oberon.USC.EDU>
Source record: 252275
Cross-posted to: comp.sys.amiga,comp.sys.atari.st,comp.sys.ibm.pc

If you want to join in the suit, info is at the end of the message.

These are excerpts from Rober Scheir's article in PC Week:

"SUIT CHARGES OKI AMERICA, RICOH WITH FRAUD OVER DEFECTS
IN LASERLINE 6 PRINTER

The makers of the Okidata LaserLine-6 (LL-6) printer knew about serious defects in the printer, but failed to tell customers about them, a disgruntled buyer has clamed in court.

The class action suit was filed April 29 in U.S. District Court by John P. Oakes Jr. of Mont Clare, Pa., according to court documents.

Almost immediately after buying an Okidata LL-6 printer in August 1987, Mr. Oakes found "severe and unacceptable" problems, but he failed to get help from either Oki America, Inc. in Hackensack, N.J. or its Okidata division, which distributed computer peripherals, according to the suit.

Between 20 percent and 80 percent of the LL-6 printers sold produced SHADOWS, BLURS and SPLOTCHES on printouts, the suit claims, because of defects in a part of the printer produced by Ricoh Corp. of West Caldwell, N.J.

Oki America's internal testing campaign revealed the flaws, but the firm went ahead and marketed the printer anyway, according to the complaint.

The manufacturer "never recalledd the units, never warned potential customers about the defects and never withdrew the product from the market to correct the defects," according to the suit.

The suit charges both Oki and Ricoh with fraudolently misrepresenting the quality and capabilities of the LL-6.

Oki America declined comment while it investigates the charges, said Vice President of Finance William J. Timmins. Ricoh corporate counsel Robert D. Polucki also declined comment while his firm investigates the complaint.

The suit is seeking at least $30 million in damages under both state and federal laws."

These are more excerpts from George Abruzzese's article in Computer Reseller (??):

"OKI, RICOH HIT WITH $270 MILLION SUIT

Oki Electric and Ricoh have been slapped with a $270 million suit for allegedly conspiring to defraud and deceive customers of Okidata LL-6

laser printer.

The class-action suit charges the companies with selling the LL-6 with a defective "developer kit" in the laser engine, which is manufactured by Ricoh. The suit further charges that officials of both firms conspired to cover up the defect and use the buying public as a testing ground to correct the problem without their knowledge.

A source, who said he was expecting a subpoena to appear for the plaintiff, indicated the charges may stem from dissatisfaction on the part of American Express, which protects cardmembers with its Buyers Assurance Program.

The source said that the buyers Assurance Program had received numerous complaints about the LL-6 and is behind the suit even though it is not named as the plaintiff.

Dennis Flanagan, Okidata's vice president of sales and marketing, acknowledged that the company had complaints with the LL-6 developer kit, but "there are currently no outstanding issues with any of our existing customers." He said that during October and December of last year the company had experienced problems with a black line that appeared along the edge of a printed page. He added that the problem had, to his knowledge, been resolved by replacing the defective developer kits.

The Ricoh laser print engine also is incorporated in products from IBM, Epson and others."

WHO TO CONTACT

If you are a LL-6 owner and have experienced the problems outlined in the articles (as I have), and are interested to join in the class suit, feel free to contact:

Steve Consul -- Attorney at Law
Kates and Mazzacone Law Firm
1604 Locust Str.
Philadelphia, PA 19103

or call Steve at (215)545-4090

Please DO NOT contact me about it, thank you. This message sent as a public service :-) Feel free to redistribute as you see fit.

Source record: 252276

Well, not a day goes by that does not bring more questions than answers. If you have the feeling that this is leading to a quesiton, then you are right.

Last night, I happened to glance through Byte's review of the 1040 (this was an old issue), and the article mentions that Atari included two new AES calls in the ROMs, called form_button and form_keyboard. My question is, are these the same calls as the ones that Tim Oren gave in column #13's fancy form_do? If not, what are they? Does anybody know what they're used for?

While we're at it, I thought about the underscore bug, and I think I have a solution, if you are willing to use your own form_do routine (or just recycle Tim Oren's). When you are getting keyboard input, you could check to see if the input key was an underscore, and if it is, then go through the validation string, find out what character position you're currently editing, and change the validation character to an X. After the keystroke, change it back to whatever it was before. This should avoid any underscore crashes, no matter what version of TOS you're using. Does this sound right? (I realize it's a pretty messy hack, in terms of the amount of effort, but if you want to do something on the ST, sometimes you have to spend more effort and time.)

Finally, thank you to all those who sent me the Pro GEM source code I requested. I have one more request. One of the ARCed files included source listing for columns 14 up to 16. If somebody has the textual part for these columns, I would really appreciate it if it could be sent to me at:

Does anyone out there have any information on TRAK disk drives for atari systems? A friend has a model AT-D1 and AT-D2 that are in need of some fixing. I am looking for any type of service manuals, schematic diagrams, or anything else to repair them. My understanding is that TRAK went out of business and I have not had any luck finding this type of information. I was hoping that somebody out there might point me in the right direction. If you can help please let me know.

Thank you in advance,

>...
> What excatly does this package do (windows on Unix(tm)) obviously
>but what terminals (explicitly does it support charcater based terminals)
>does it support & what version(s) of UNIX does it run in
>...

UW is a package which implements a terminal elmulator on the
Macintosh, with the capability of using several windows on the
Macintosh side. The I/O of these windows is multiplexed over a serial
line to the UNIX side. There the UW will be started after the first
window has been opened. UW now (de)multiplexes the different streams
from and to the windows on the MAC.
But you need a system which has ptys, otherwise it is difficult to
get it running with multiple windows.
The window front end has also been ported to the ATARI, the UNIX part
remains the same.

Hope this helps.

>Does anyone know of a touch-sensitive screen attachment for STs?
>
>--
> Doug Collinge

I know of two companies producing touch screens that can be
used with the Atari ST:

Tektronix:
They have a unit that can be retro-fitted on
the ST 13" monitor. I've written drivers for
this one. It works, but it is expensive,
about $1100 in small quantities with no software.

Micro Touch:
Similar to above. OEM pricing. Performs slightly
better than the Tek, in my opinion.
Micro Touch has larger 19" touch screens too.

Another company (I forget the name) makes a screen that is like
a mesh that phyisically sticks to the face of the monitor. It's
a lot cheaper than the above screens (which are actually glass),
but I'm not sure about the reliability or performace.

> Most of the keys of the 'Arrow Keypad' are redefinable (Example:
> you can turn <Help> into scrolllock or other braindamage).
> Mouse buttons send user-definable characters in GIN-mode

Now, if this isn't a good support!

My last (I think) wishes are:
- To be able to set the RS232 Parameters through a macro.
- To have the terminal emulator accept a sequence for changing
screen modes (80/128 cols 24/49 lines) but wouldn't
clear the screen (at least) when the mode requested
is the current.

I wouldn't like to sound greedy though ...

Uniterm is more than satisfactory as it is already.

Thanasis

From: piet@ruuinf.UUCP
Message-ID: <447@ruuinf.UUCP>
Source record: 252284

Is there a way to find out what kind of file is connected to a file handle,
e.g. disk file/keyboard/screen.
In some old Atari doc I found F_ioctl, but that doesn't seem to be
implemented. The problems come up when you run a program with stdin/stdout
redirected by a shell.

I assume the GOBANG game you are talking about is the one I did write some time ago. The 'Official' option has never been included. Neither have I made any other improvement. One of the reasons is that I don't really know what the 'Official' rules are. (Somebody told me they existed but I never learned about them.) So if somebody can tell me ...

I must say that I myself am also quite surprised how well the program plays. Maybe some history. Quite some time ago I implemented the well known game of putting stones on piles and getting four on a row. The technique used was straightforward backtracking with only limited cleverness. A friend of mine told me wheter I could do GOBANG in the same way. My reply was that this was a lot harder because the number of possible moves is very big and, hence, backtracking won't work. Because he continued asking I decided to program the thing completely without backtracking, just looking at the current situation. I was convinced that this would result in a program that was trivial to beat. When I got the first working version ready and started playing for the first time, to my surprise I was defeated in a few moves. Also the second and third time the program did win. Since then, only minor changes have been made to the strategy. Only in the top two level backtracking is added, and only in the case the computer can make rows of 4 (forcing the player to a particular move). Also some randomness was added to avoid similar games all the time.

Since I wrote the program I beat most humans as well. the strategy of the program is so easy that you can play it by hand as well.

Mark Overmars

P.S. there is a UNIX version of the program as well, although it is an older version that is a bit less clever. It uses CURSES to handle the screen.

>

Get your facts right.
1. The ST and Amiga both have 68000. This is a very different story
than a 68000 emulating a 6502.

2. An Amiga can be expanded up to 8 megabytes without too much troble
just expensive.

3. The amiga low resolution is 320x200 32 color.

I own both machines. I like the ST better, but I see no reason why a 1Meg
Amiga couldn't emulate a ST at 1/2 speed.

While trying to debug a large bit of code (6 files about 30,000 lines
of code, one of the files produced by a special processor) I ran into the
problem of "where the heck am i". My brother is a Beta tester for MWC and
had beta test version 2.9 (or the version with 2.9 beta MWC). I took my code
over to his place, recompiled it and started looking through it with CSD.
Ran into immediate problems. I don't know about the shiped version but #line
preprocessor statements got this version lost. I edited the file produced
by my special processor to delete the #line statements and retried. I had the
answer to my addressing problems figured out, fixed, tested and gone 10 minutes
latter. My opinion of CSD is:

THANK YOU!!!! THANK YOU!!!! THANK YOU!!!! THANK YOU!!!! THANK YOU!!!!

Product of the year for the ST. One other little problem is I can't seem to
get it to work with Beckmeyers Multi tasking Shell but I think it is something
I have set up wrong. I am looking forward to the new manuals coming out but
I might suggest to Mark Williams (or David Beckmeyer) that they include a
section on setting up MWC and the MT-Shell to run together.

...
> Phil Paone
...
> "Admiral...There be whales here"

There is apparently one unusable argument passed, the name of the
program. argv[1] _always_ is the first argument after the program name.
So argc = 2 so one can for (i=1;i<argc;i++) printf("%s\n",argv[i]);
instead of kluging for (i=1;i<argc+1;i++)... to get the list.
^^

was in error. This is correct - I said what I said, not what I meant :-)

What I said was that the ST 68000 is usurped for video refresh - this
is of course incorrect. What I meant to say was that ths ST's 68000
is usurped to move information around on the screen (including any
text). I was aware of this all along, guess I slipped 'cos I was
a little peeved at the tone of the original message - my apologies
to all.

I stand behind the rest of my message. I post this merely as a correction,
now perhaps we can get on to more constructive discussion.

The standard GEM desktop (I don't think that the desktop alternative
I saw advertised does either) will NOT do batch files. The reason is simple:
The desktop interprets clicks & such, not text. One possible way of doing what
you're talking about is to install a specific extender(s) (".SH", or ".BAT", I
dunno) into a shell.

I have no idea as to the volume of software sold via dealers vs.
Mail Order in Europe, but if I'm in doubt, I'll pay the extra $$$ that the
dealer charges to see whether or not the game (or anything else, for that
matter) is worth getting - it would seem that this would be a, uh, viable
way to find out if it ran in Mono...

Quick instructions to get HFS up on hard disk:
1. Format TWO partitions, one small MFS partition to boot from, and the rest to your HFS. These must be one of the Four "standard" (as opposed to Supra's extended ones) partitions. Use the Magichd program to do this. The MFS only needs to be large enough to hold a minimal System file and Hard Disk 20 (but I have my own transfer program which can access my MFS partition and move files back and forth, so mine is bigger).
2. Boot from floppies (having prepared two MFS floppies, 400K, beforehand). Copy ONLY system and finder to one, and System, Finder, AND Hard Disk 20 to the other. Reboot with the disk without Hard Disk 20 (this is needed since HD20 likes to eject each drive as it continues the boot). Now Mount your MFS partition (usually shift-F3) and copy System, Finder AND HD20 there.
3. Reboot from hard disk and it should come up, but you then have to add System and Finder to your HFS in a system folder to complete the process.

I have removed Finder from my MFS partition, and reduced System to nearly nothing since it isn't used except for booting (One small DA, no fonts, etc.). I also have used the resource editor to remove the .sony driver from HD20 (leaving only the dispatch kernel and TFS). I also removed HD20 from my HFS since it INIT's from the MFS.

FACT: The USA has more natural resources than Japan.
FACT: The USA has a more efficient form of government.
FACT: Business success in the USA is greater than in Japan.
FACT: The USA has more "bargaining power" in most areas than Japan.

FACT: Japan has a more organized, more efficient work force.
FACT: Japanese companies have more pride in their products.
FACT: Japanese companies are mostly hi-tech electronics companies,
so they have little need (unlike the USA) to diversify and can
therefore enhance and improve their products continuously.

Any other questions? Personally, I try to buy American whenever possible (I refuse to drive a foreign car, unless it's a Lamborghini), but there are some areas -- mostly technical -- that Japan excels in.

From: helix@bucc2.UUCP
Message-ID: <56200002@bucc2>
Source record: 252205

A couple of weeks ago, I had started to program a Bulliten
Board System for my ST. I have, however, run into a few problems
with the I/O routines for my RS-232 port.
First, I tried to open files to "aux:" and use feof() to see
if any characters were in the buffer, but that did not seem to work
properly. Then, I just changed the routines and used some GDOS functions
like Cauxin, Cauxout, Cauxis, and Cauxos. These seem to work fine, but
they do not use buffers. I would like to write this BBS so that it doesn't
use too many system dependent functions. Is there any way I can access the
RS-232 port with the standard I/O functions or do I have to stick with
GDOS?? Also, I am using the right approach??

Any help would be deeply appreciated....

No.
There is an "full featured" assembler in the package (but I don't like
it :-) and something like "move.l 0,0x40c" (steprate, right?) can be
done with "poke()".

C is almost, but not quite, entirely unlike BASIC...

Yes you are wrong. In fact your postings show you have little idea of how the ST really works, and I'm being to think you don't really understand what happen in the Amiga either. Anyway here is the facts.

Unlike the Amiga the ST screen size is always 32k bytes. This of means that as you increase the resolution the bits/per pixcel decrease. Hence while you can normally get only 16 colors in low resolution, there are only 4 colors in medium and the monochrome mode of has the highest resolution. There is no interlacing and no overscan (two things the ST should have, these are outstanding features on the Amiga). Anyway no matter what screen resolution you use the 68000 doesn't see any differences in memory access.

Now we come to the part that most Amiga people are really goofed up about. Under normal conditions the 68000 will at most access memory every other cycle. There are a few exceptions, but they don't happen very often. So as it turns out at least half of possible memory cycles are used by the 68000. The Amiga and the ST both have extra hardware to use the memory extra cycles. The Amiga has more hardware doing that, but the ST actually has hardware doing some of the same things that the Amiga does.

The Video Shifter in the ST uses the bulk of the excess memory cycles. It simply moves the memory out the display hardware. It doesn't do this during vertial retrace so the are still left over cycles. These get used by the DMA stuff and the DMA can steal cycles from the CPU. Normally only a few cycles can be lost to the 68000 without DMA. That is the few times a the 68000 and the video shifter get out of sync the 68000 has to wait a cycle to get it back in sync so that the Video Shifter and 68000 are using alternate cycles.

The Amiga is far more complex. During "normal operation" the Amiga will lose more cycles than the ST and it has to stay in sync with 4 things instead of 2. Still the idea is the same - alternate cycles go to 68000 with the others

going to support hardware. The Amiga has more flexibity in graphics modes, but that amount of cycles the 68000 gets varies with the modes you using. The Amiga graphics modes are very flexible from about 320 x 200 1 bit plane to about 704 x 452 4 bit planes interlaced. Or another way to think of it is 8k of memory to around 150k of memory. At some point, I think about about 40k of graphics memory the graphics refresh starts cutting into the 68000 cycles. This is easy to test, but I haven't done it for some time, just write a basic program and time it in the various display modes.

Things like blitters and the copper do help out but are not always useful for every program. The copper in my mind is much neater than the blitter and is much more unused than the blitter. Anyway the Amiga pays for it's flexiblity in general speed. Some things that lend then selfs to the extra hardware the Amiga has do fine. (windows are a good example of this) Other things can slow down depending on how much flexiblity of the Amiga is being used.

I wish the ST had all the flexiblity of the Amiga. Still there is always a price to pay for flexiblity. In compareable mode the Amiga and ST run neck and neck in speed. (often the ST has a speed advantage) In modes where more graphics specail stuff in being use the basic speed of the Amiga can really slip, but hey at least you can do those modes!

If you want something to be proud of, think sound. The basic sound on the Amiga is great - best I've ever seen. And enjoy the flexiblity the machine has. A lot can be done with it.

Sure. Write yourself a command interpreter. Call it "batch.ttp".
Install this as a "TTP" type application, with file type of "bat".
Create your script of batch commands for this processor to read using
any text editor; call the result "file.bat". Double-clicking on
"file.bat" will launch "batch.ttp" with "file.bat" as a command-line
argument. Your batch program then parses its input file, pexec'ing
the programs named therein. When each command completes in turn, it
reads the next line and repeats, until end of file, at which time it
exits.

"batch.ttp" shouldn't take more than a couple of hours to write and
debug.

4016. Supra Clock!

Newsgroup: comp.sys.atari.st
Date: 1988-05-23 22:54:24 UTC
From: #JMKLAS@WMMVS.BITNET
Message-ID: <8805240001.AA27680@ucbvax.Berkeley.EDU>
Source record: 252215

I purchased a Supra 20 MB hard drive about three weeks ago and was very happy to find a couple of extra features that I didn't have to pay for... Several friends of mine bought Supra 20's a year ago. One of them included an extra port on the back, the other's didn't. To make a long story short, mine had two ports on the back (don't know what they're for -- Supra documentation hasn't been updated recently), and a battery backed-up clock! I'd like to commend Supra for continuing to add features to their products without charging extra!

To get to the point, the programs that are included on the utilities disk for accessing the clock do not work (at least not as expected). SUPCLKRD (to READ the clock only) does not update the system clock at all. SUPCLOCK (I believe that's the name of it), the clock SETTING program, works just fine, and WILL set the system clock if the 're-read' time option is used after setting the clock first. Since the intention of the SUPCLKRD program is to set the system time from an auto folder, it's very unfortunate that it has no effect on the system time!

Has anyone else run across this problem and/or contacted Supra about it? I'd love to be able to use this thing!

Thanks,
<John>

4017. Re: Amiga emulation of ST

Newsgroup: comp.sys.atari.st
Date: 1988-05-24 00:19:10 UTC
From: wayneck@tekig5.TEK.COM
Message-ID: <2799@tekig5.TEK.COM>
Source record: 252216
Cross-posted to: comp.sys.atari.st,comp.sys.amiga

Here is some more information. I forgot about the fast ram vs. chip ram stuff on the Amiga.

On Amiga:
|>At some point, I think about
|>about 40k of graphics memory the graphics refresh starts cutting into the
|>68000 cycles.

| You might also mention that this "cutting into the 68000 cycles" only
| applies to the first 512K (Chip RAM). The other 7.5M of memory does not
| get "cut into" for any video mode (fast RAM).
| Mike Kersenbrock
| Tektronix Microcomputer Development Products
| Aloha, Oregon

This really is true to my experience. An Amiga with 1.5 Megs seems to be a much faster machine than the basic 512K Amiga. When you have a ram disk and other software to enchance the Amiga's disk drives it really improves. Getting rid of any cycle stealing also helps. On the ST you don't see as much improvement since cycle stealing is very rare unless you are doing DMA.

My impression is that a 512K ST often out runs a 512K Amiga. But if they have lots of extra memory, the performance of the Amiga improves much more than the performance of the ST. I do have both machine, but only 512K on my Amiga now.

> This seems particularly stupid to me as Atari claimed somewhere
> that most of their european users had hi-res rather than colour.

This is a constant problem for anyone who owns a mono-only system; people who control software (publishers, and bbs sysops) just refuse to take seriously the fact that not everyone owns a color system. Hence, you waste time downloading that fun-looking program, and treat yourself to a fine display of bomblets. I've asked the Boston Computer Society's Atari-group sysop to indicate monitor requirements in the listing of downloadable files, with no success; that this also happens with software you have to pay for is ridiculous.

It shouldn't be so bad in Europe, where most systems are said to be mono (in the US it's substantially the other way--except among programmers?) At least the net archivers here understand computers well enough to put all the relevant information at the head of a program file.

>you out there have used both, so could you give him recommendations on which
>computer to buy and facts to back them up? Thanks.
>

I've often considered the possibility of creating a virus program that would
propagate along UseNet nodes, doing the following:

1) wake up once a week.
2) look thru comp.sys.amiga, searching for references to the ST.
3) look thru comp.sys.atari.st, searching for references to the Amiga.
4) compile the results of (2) and (3) above, determining the ratio of these
references to those messages without references to the other machine.
5) if the ratio falls below 2 percent for the week, send out a message
similar to the above.

Perhaps I no longer need to consider it.... :-)

I seem to have had something in the boot sectors of my disks that seeks
out program files (.TTP, .PRG...) and causes them to no longer be able
to read their data files (even when said files are perfectly good,
on the ramdisk, etc.)
The 'Peniciln' program stops this thing from attacking any more files.

Has anyone seen such a thing before? I'll try to get some more inforamtion
with my sector editor, assuming that I didn't kill all my copies already.
(It seemed to spread very fast...)

Dear Jeff,

I have been using "lv". Someone told me it
was more complete than STevie. I have a copy, if you like..
You can pick up a copy from either water or watmath, perhaps?
On both machines, the file name is
/tmp/lv.arc
I would be interested to know your reaction to "lv", whether you
think it is better or worse than "STevie".
I also copied to
/tmp/stevie.arc
on the same two machines.

Yours,
Lee Dickey

> GARY TATE

Gary Tate.

Not quite sure where you are calling from.
There is a program called. ARC.TTP and another one called Dcopy. These are
the two main programs for ARC compacting and uncompacting. If you give us
an idea of your location, we can probably pinpoint a few ST based bbs's
for you to call to get either of these programs. For instance in NY state:

Crystal Palace in the Rochester area of NY, 716-458-2638
Dateline in Brooklyn?, NY, 718-648-0947

In New Jersey, I call :
AtlantiST 201-286-6189
Calcom 301-681-8933

To name a couple on the east coast. In the Midwest

Mhz in Indiana 812-379-1162
Griffin in Michigan 313-332-5452
Club II 313-334-8877

Any one of these systems should have this and many other files.
Enjoy the world of the ST.

>
Jerry
As mentioned Degas Elite will load Neo pictures into the program and
save out as a Degas file. However there are several programs which will
do that for you in the Public Domain as well plus other kinds of Snapshot
programs as well.

When I want to save a picture of ANY resolution or with or without the
Desktop menmu bar around, I use a program called Degasave.prg which I have
previously loaded into my Auto Folder. This program is really nice in that
it traps the Alt-Help combination, which is usually for a screen dump to
the printer. It dumps the screen instead to the disk in whatever resolution
you are in. You can save as many as you like up to the disk space limitations.

There are several versions of this kind of program. This one is without
documentation, and when ARC'd is 768 bytes, but is about 4K unarc'd. The
others do it in different ways. One popular one needs two programs or
are they accessories. Haven't used them for quite some time. This will
use the Alt-Help combination to save a picture, however, it doesn't save
directly to the disk. It buffers it to a portion of screen memory and
takes up a LOT of room if you have several screens to be saved. When you
exit the program you call upon the accessory and then save the screens.

Now, for the picture conversions and drawing packages. The only one I know
for sure that generates a compatible IMG file is EasyDraw. Maybe JILCAD
does as well. BTW, Publishing Partner uses any one of these formats
according to our newsletter publisher. Tnystuff and its' newer versions
all allow you to interchange between at least TNY, NEO, and PI? formats.
The latest of this popular Shareware package will also convert from
and maybe to other formats as well, including IFF and MAC pictures.
If you want the ultimate all in one picture conversion tool, I have seen
Picswitch in several incarnations, most notably Picsw6 and Picsw7. These
were 0.6 and 0.7 versions of a ShareWare package from John Brochu. Really
nice programs and useful if you have pictures in Atari 8 bit, IFF, MAC
and a variety of choices which you might want to convert to Degas and or

NEO pictures. I believe there is a version 1.0 coming out, which is to be gotten only by registered users of the older versions. It is an excellent program which should be supported. (Note Degas Elite will also convert from ALL these formats. but it will only save to Degas format. It also has an Accessory which will convert TNY pictures as well.)

Hope this helps. If you want the Degasave program, I am not sure if I have sent this to Steve Grimm yet. Thought I did.

George Seto - using a friend's account.

4032. Virus Alert

Newsgroup: comp.sys.atari.st
Date: 1988-05-25 02:08:10 UTC
From: kibo@pawl20.pawl.rpi.edu
Message-ID: <906@imagine.PAWL.RPI.EDU>
Source record: 252232

(this is a repost. seems my previous posting was sent out from a machine which
didn't spread it - plz forgive if you saw this already.)

I found, three days ago, a virus I had not heard of, on my ST. I'll
attempt to tell you everything I can find out about it, here.
Be warned that I am no expert on virology.

I made sure that this was a virus, not a glitch, by running the usual
gauntlet of coldstarts, memory checks, rebooting from write-protected
system master disks, comparing backups with originals, etc., and I am
confident that this was no fluke.

My system configuration is 1 Meg 1040ST-F, one floppy drive, no hard disk.

ACTIONS OF VIRUS

Seems to attack only executable programs (.TTP and .PRG files were damaged/
destroyed as will be explained; no other files were touched.) Program
files either:
(a) vanish or
(b) become damaged so that they are still executable, but have severe
difficulty accessing data from disks (physical or RAMdisks). For example, I
had two working backup copies of Megamax C before this happened; they have both
been affected and now both perform in the same broken way - either crashing
when they try to compile a good .C file, or claiming that the data file
is about 50% garbage (and the garbage the compiler claims to see is
invariant from try to try, even after coldstarts, for both copies of
the compiler, and my original copy can display the files just fine.)

The virus does not seem to destroy an entire disk's contents at once - it
seems to take files one at a time. I don't know how often, under what
circumstances, etc., but I do know that a good disk can have several files
damaged/erased in about an hour (assuming you're using the disk
frequently, as I did in this one case).

I lost many executable files to the virus either by having them removed or
corrupted in this odd way. No cutesy 'Ha Ha' messages or any such ever
appeared.

PROPAGATION OF VIRUS

It lives in the boot sectors, and can be killed with PENICILN. I don't
know how often it copies itself, or when it does; I think it had spread
to several disks since I realized it was around, but I think that
I actually received my copy of the virus a few months back, so it may
have been idle.

PENICILN definitely stops it.

Basically, I'm at a loss for further information. I Peniciln'ed all my disks frantically (once I tried it on an infected disk to make sure that I would do this) before I realized I should have saved a copy, so I don't have a 'live' copy of the virus. I do have some damaged programs remaining, that I will diff with the originals sometime, and will see if any deleted files can be undeleted (once I get my shareware disk utilities back :-( )

Has anyone else experienced this weird and evil virus?

Kibo (Jim Parry)

>on the ramdisk, etc.)
>The 'Peniciln' program stops this thing from attacking any more files.

PENICILN will kill most anything, virus or not. While that's a saftey
factor, it is rather deadly to disks that are supposed to be self booting.

I'm working on a more intelligent program now, but I need more virus samples.
If anyone suspects they have a virus infected disk, please send me a copy.
If there is a virus, I'll let you know what it's been doing, and add
detect-and-kill capabilities for it to the program.

Yet Another Wanrning Department: One of the virus infections I have a copy
of does not destroy files. It spreads itself like any other virus, but the
attack it launches is more subtle. It waits until the ST has been running
for a while, then does random memory accesses, at random intervals. It
will either step on some word in the screen RAM, causing a glitch on the
display, or some byte above the screen, which may cause a memory address
bomb. So, just because you don't have files being corrupted, don't think
that your system is virus-free. Be wary of new disks, and rely on the
write protect tabs to prevent spreading.

One of the newest virus infections contains code that intercepts the error
if you try to write to a write-protected disk. That means that while it
can't spread to a write=protected disk, you will not get an error when it
tries, so you'll have no clue that it tried. They're getting sneakier...

My next tool will be out soon. Meanwhile, please send samples of infected
disks to:

George R. Woodside
5219 San Feliciano Drive
Woodland Hills, Ca. 91364 USA

Thank you.

Hi folks,

In Info-Atari16 Digest Monday, May 23, 1988 Volume 88 : Issue 263,
Gareth Husk writes:

>Okay folks I have a little request. I have got a little fed-up
>trying to find the odd arcade game that will run on a hi-res
>monitor.
>
>So can any of you out there give me some information, plus a
>rating &c. None of the mags in this country gives the necessary
>info. Frequently neither does the packaging.
>
>This seems particularly studip to me as Atari claimed somewhere
>that most of their european users had hi-res rather than colour.

Very true. For this reason, a lot of european games are working in
both resolutions. For example, all the Firebird and Rainbird games
I know are working in monochrome and color (both companies are
subsidiaries of the british telecoms, I think):

- The Pawn (adv. game, great graphics, funny plot, great parser)
- Guild of Thieves (same as above but even better)
- Tracker (good strategy game)
- Starglider (greatest 3D arcade game with some thinking too after 1st
level)

And here in the US, Sublogic made Flight Simulator II for both rez,
and good ol' Silent Service works fine too with B&W.
On Genie you can get a Public Domain clone of Lode Runner for
monochrome only (sweet revenge!), and this implementation is great!

Something missing on the ST is a hardware to see a color image with a
monochrome monitor (i.e a chip doing the same thing than some recent
softwares). But I will glady swap this chip for a good blitter.

I hope this will help to hamper your productivity :-)

I use GULAM and have a number of little GULAM scripts that make things easier for me. For instance one that I use at startup (gulam.g) sets my favorite aliases and copies some of my frequently used programs to my Ramdisk. GULAM is available from a couple of file servers, I think.

OK?

There is a variety of ways to do that. The one I use involve a command
line interpreter (CLI). You have at least command.prg from Atari and MSHELL
from Michtron. Then you run a text editor and you create a batch file
according to the syntax of your CLI. The extension of such files is usually
".BAT".
Next you click the Install Application item in the Option menu of the
Desktop (after selecting your CLI), and you enter ".BAT" on the line "File
Type". This will allow you to automatically run the CLI anytime you
double-click a .BAT file (given that the CLI is able to get the
file name passed by the Desktop. It works with MSHELL, I don't know
for the others). This way you get the same thing as double-clicking
the CLI and runnig the .BAT file from the CLI.

>
> -Matt

At no time ever does video refresh "directly" take time away from the 68000 on the ST. However because the ST's cpu and the video refresh system run at different clock rates they can get out of sync. This can happen in any mode, and causes an added wait state. This is why when cpu-only speeds of the ST and the Amiga are compared you don't just say that the ST is 8/7.16 (?) percent faster; you have to give a range (say 5-15% or so).

Also, monochrome mode on the ST is NOT "directly" slower; the amount of memory that the video shifter has to access in monochrome mode can "normally" be accessed in cycles where the cpu is off the bus, similar to what happens in a color mode. Where you might see a slowdown is:

a. depending on the exact program being run, you might see the "out of sync" condition described above in the first paragraph more often.

b. normally the ST has a not insignificant amount of code connected to the vertical blanking interrupt (and user programs can enable other video interrupts). This code will get called more often in monochrome mode.

Cross-posted to: comp.edu,comp.emacs,comp.sys.att,comp.sys.atari.st,comp.sys.cbm,ba.general

Originally I was amused. Then I grew weary. Now I'm *PISSED*. I've seen this same message in at least three separate newsgroups over the past week or so. And today, it's appeared in two more newsgroups (so far).

Some suggestions:

1. Everybody send an envelope with a blank piece of paper in it to:
Jay-Jay's College Fund
PO Box 5631
Lincoln, NE 68505

If we all do this, it will flood the post office in Lincoln, hopefully pissing off the postal authorities. If we each put a blank piece of paper in the envelope, this clown will have to open every envelope in case there really is money in it.

2. Put JJ@cup.portal.com in your global KILL file (if you use rn or some other newsreader).

3. Follups directed to alt.flame.

4041. VIDEFX3D for Amiga; Atari equivalent?

Newsgroup: comp.sys.atari.st
Date: 1988-05-25 21:13:09 UTC
From: lasibley@lion.waterloo.edu
Message-ID: <7035@watdragon.waterloo.edu>
Source record: 252241

The following article appeared in comp.sys.amiga and rec.video:

In article <3073@leo.UUCP> harald@leo.UUCP (Harald Milne) writes:

> VIDEFX3D is a new generation of video titling software for the Amiga.
>Where previous video packages dealt with simple video overlay transitions,
>this software does what is the equivelent of VideoScape3d, only much simpler.
>
> You can use stantard generated titles, use polyfonts, use chrome fonts,
>etc. The fantastic thing about this package is the ability to move titles
>in planes of 3 dimensions. Of course this takes some compute time, but the
>playback is in realtime. The effects are very smooth and professional.

Is there anything like this available for an Atari 1040ST? I am involved with a group called Slipshod productions which produces Star Trek parodies on video (NB this is for our own personal enjoyment, and *not* for profit; we don't plan on selling *anything* we produce, merely showing them at conventions, *free of charge*). Anyway, I have an Atari 1040ST, but I know next to nothing about graphics. It would be nice if I could get this package for my machine and then produce the credits for our projects.

If there is such a package, would the quality be reduced considerably when used on a TV? I haven't got a colour monitor, and don't have the resources for acquiring one. (ie. I'm relatively broke)

I'm interested in getting my hands on all the Spectrum pictures I can. I am going to set up an archive for them here; mail all your good pictures to atari-pix@ssyx.ucsc.edu (...!ucbvax!ucscc!ssyx!atari-pix) and I will sift through them. Please include a descriptive title (preferably more so than most picture filenames) so I can create a nice index. I'll also take DEGAS and Neo pictures if they're exceptional, but mostly I'm interested in Spectrum pictures. I realize that I'll get a lot of duplicates; I'm prepared to deal with them. Uuencoded .SPC files are best. I will post an index of pictures, along with instructions for accessing the archive, in a couple weeks.

Thanks!

In his 24 May 88 04:34:43 GMT John Purbrick writes:

>It shouldn't be so bad in Europe, where most systems are said to be mono...<

[hollow laughter]

I'm the only person I know with a hi-res ST. Most people seem to plug theirs into the back of the telly.

I've got one game, and it's Balance of Power. Brilliant game, and well worth the money, but, having run the ST as mid-res for a week or two, I certainly know what I'm missing -though Star Wars is still not really an acceptable substitute for Star Raiders, and it wrecked my mouse.

Nobody here seems to write games for the hi-res ST - which rather surprises me; I'd have thought someone might have tried porting Mac (spit) games by now. BoP appears to have originally been written for the Mac (spit).

Since I'm clearly stuck with it, can anyone recommend a spreadsheet system? I'd like it to be compatible with 1st Word Plus, if at all possible (sigh).

I suppose I should rig a monitor switch and a modulator so that I can plug it into the back of MY telly. I thought I was through with all that....

Regards,

Chaz

>of the screen. Does anyone know about this ??? I don't.
>
>
> Bye, Peter

Humm, looks like no horizontal scans are done (I'm not quite sure how to say this in English; it seems the voltage for horizontal bending the beam is constant). Are you sure that the IPL mask in the status word is set correctly? I know that the standard HBL does something like:

```
move.w sr,d0
and.w #$700,d0 * test the 3 IPL bits.
bne.s nochange * if not zero
or.w #$300,sr * could be wrong; don't know if this is valid
nochange
rte
```

The ipl bits are available on pins of the MC68000; these probably are used to communicate with peripherals (interrupt control lines). It could be that your HBL is not run, or that it does not set the interrupt control lines correctly (using the status word). Maybe you could supply some more info (could be mail) ?

Leo.

> Any help would be deeply appreciated....

Your best bet is to use Bconin, Bconout and Bconstat. Route all of
your RS232 out to a small set of routines which can be written for
any machine you want to run it on.

This is what is done for FoReM ST and FoReM PC. The ST version
uses the TOS RS232 driver (although fiddling with the buffers) and
FoReM PC uses the Greenleaf Communications library. Other than that,
the codes is 99.99% the same.

>frequently, as I did in this one case).

First, it's unfortunate that you don't have a copy left, since I'm still
trying to get a copy of this one (if it's the one I think it is).

This one (assuming it is the one), is a FAT saboteur. It spreads in the
usual manner, copying itself into boot sectors when the BIOS Media Change
routine accesses a new disk. I don't have any information yet on the
delays it has built in before it starts its dirty work, but the basic
technique is to periodically step on small portions of the FAT (File
Allocation Table). This results in either the premature termination
of a file, or altering the file contents by re-directing the operating
system's trail of sectors that make up a given file. Since it makes
only small changes each time it strikes (I think), you won't notice it until
you access a file that has been hit. Note that since it strikes at the FAT
(both copies, I believe), copying the file yields a bad copy.

Another victim claims that file data was also destroyed, but I believe
the data destruction was a side effect of writing something to the disk
after the FATs had been sabotaged.

The bottom line is that if you haven't written to the disk, the file data
is probably intact, although you can't access the files reliably due to
the FAT damage. You can probably recover text files with a disk utility.

You may be able to recover executables, but only if you're either real
lucky, or a real wizard.

I'm still looking for a copy of this one (and other virus anyone may encounter)
to add it to the next virus killer.

Please send infected disks to:

I have a few questions for anyone { David Hakins } on what modem to buy to get a Well account for my Dad. First I am a Microwave/Audio person and I always need guidance when it comes to computers. Can someone give me a model number that will work with rn and read news. Also how many catagories are on read news. Is rec. aviation, rec.audio, ba.forsale and rec.video in the read news system?

Thanx,
Dave

4049. re: Personal Pascal GEM question

Newsgroup: comp.sys.atari.st
Date: 1988-05-26 14:48:00 UTC
From: DMiddleton@HIS-PHOENIX-MULTICS.ARPA
Message-ID: <880526144826.794202@HIS-PHOENIX-MULTICS.ARPA>
Source record: 252249

If you do a dialog, the system puts back what it thinks should be under the dialog box. in personal pascal. I have found this and have resolved the problem using the PP Scrn_Save and Scrn_Restr functions. Hide your mouse, snap a copy of the screen, do the dialog, begin update, restore screen, end update, show mouse.

This works very well, but I think it is a feature, rather than a bug. On mono, one gets a grey desktop, but this solution will take care of the problem. I think it is legit though, since alerts warn of not exceeding 25% of the screen size (it saves it?) so if your doing alerts it is just a fancy way of speeding up the process of dialogs.

Someone mentioned the Dave Beckermeyer Multi Tasking shell on the net recently. Is this available in the U.K. and what specifically does it do (i.e. to what extent does it multitask) ?

Also, can anyone tell me when Minix for the ST is due out in the U.K. ?

Thanks in advance.

4051. MIDI problem

Newsgroup: comp.sys.atari.st
Date: 1988-05-26 17:16:04 UTC
From: gdr@pbhya.PacBell.COM
Message-ID: <14252@pbhya.PacBell.COM>
Source record: 252101

A program I wrote creates a string of 256 notes and sends them out the MIDI port one at a time. The problem is, it never gets through the whole string. I don't think it's a software error because: 1) It never stops at the same place, sometimes it gets through 150 notes, sometimes only 5, and 2) there is no random function in the program that could explain this.

What happens when the notes stop is that the monitor blinks and the disk drive starts up (usually). Sometimes I get 4 bombs, if the monitor doesn't go nuts.

Any experienced music hackers out there? What do you suspect? The cables? The optoisolator? My DX-7? A bad chip? Or if it's software why doesn't it bomb at the same place every time?

(Possible hint: I am using timer C when sending the notes.)

Hi there,
I've just got a phone-call from de dutch distributor of GFA-BASIC.
There is a book called GFA-BASIC 3.0 with has a disk inside.
This disk is infected by a 'boot'-virus.
You can kill it with the standard viruskillers.
You can also bring it back to the place where you bought it.

NOTE: It is NOT the disk with the BASIC interpreter (3.0).
That one is allright.

The book is written in German by: G.P. Engels & M.C. Gorgens.
ISBN-3-89317-004-9

I thank GFA-System-technik for letting us know. They could keep it quit if they like, but the didn't. That's sportive.

Micro RTX added this feature to TOS. There are two calls to determine
characteristics of a file handle. Here's the simplest way:

type = Ftype(fd);

The value returned by this call tells you what the handle is:

0-15 The BIOS level device number (e.g. 2=console)
16 A regular file
17 A pipe

Maybe a future versiaon of Atari TOS will also support this.

Mg is an ersatz-emacs text editor that is smaller, faster, more portable, and less functional than GNU emacs, the editor it is patterned after. As much as practical, it tries to act as a subset of GNU emacs.

Mg version 2a has been submitted to comp.sources.misc. Previous versions (1a and 1b) were known as MicroGnuEmacs. (1a is in the comp.sources.unix archives, 1b was only distributed via ftp.) This release has many improvments over the previous versions, including completely rewriten key mapping, keyboard macros, and a new manual (thanks to Sandra Loosemore).

Support is included for the following operating systems:
BSD Unix
Sys V Unix
Os9/68k
VMS
Atari ST
Amiga
Primos

MSDOS support was planned, but was not completed in time for this release.

[Followups are redirected to comp.sources.d only.]

Seems like just a few weeks ago, there was a net discussion of liability
of a commercial vendor if a virus was found on a commercial distribution.
Someone's crystal ball was tuned in quite clearly!

If someone will reproduce this disk, and mail me a copy, I'll add this
virus to the detect-and-kill capabilities for the next posting of the
virus killer.

I recently added their upgrade drive kit (on sale? at $129, sure wish I would have waited a bit) to a PC-clone. These drives will work on the ST, with one very large caveat - Radio Shaft machines have drives that are built specifically for their systems, and they distribute the power (+5, +12) on some of the pins on the 34-pin connector where ground is on a normal drive. This is not really a problem if you have a continuity meter and an exacto knife (e.g. cut the traces from the power connector to the 34-pin connector), but this will, of course, keep you from returning it if you screw it up. Other than this headache, and the 14-pin non-standard connector on the ST, you should be in good shape.

4062. Atari ST developers' Network

Newsgroup: comp.sys.atari.st
Date: 1988-05-27 15:26:10 UTC
From: davidli@umn-cs.cs.umn.edu
Message-ID: <5656@umn-cs.cs.umn.edu>
Source record: 252112

```
STdNet - an Atari ST developers' Network
----------------------------------------

What is STdNet?

STdNet is an alliance for those who develop software for the Atari ST
computer. Members maintain contact via mail, both paper and electronic.
The principal means of electronic communication is USENET. A program called
UUMAIL enables members to send and receive mail, including mailing lists,
via USENET.

What are the goals of STdNet?

Primary goals:

1) Act as a clearinghouse for information relating to the Atari ST -
both hardware and software.

2) Disseminate information regarding "standard" ways of performing
some software operations -- including standard library routines,
ways for getting around bugs in the Atari ST operating system, and
common programming problems.

Secondary goals:

1) Provide electronic mail communications between Atari ST developers.

2) Provide a software library containing source code examples in
a variety of languages.

3) Provide a cohesive voice to express our desires (and help) to
Atari.

Other goals:

1) Maintain and disseminate a "catalog" listing of software
developed by members.

2) Maintain and disseminate a "catalog/review" of PD software.

3) Provide a "help line" to answer questions from Atari ST developers.

How can you join?

Send an electronic mail message to:

ftg!dwm@stag.UUCP
or
Send a letter to:
```

David Meile
STdNet
P.O. Box 13038
Minneapolis, MN 55414

I've posted this a while ago, but have not seen it up on the network, so I am reposting it. Sorry if you've seen this twice. STdNet came out of some discussions we've been having at the MAST Programmers meeting (MAST is the Minnesota Atari ST users group). We hope to encourage anyone who is interested in programming on the ST (including non-Atari registered people who write software).

-- Dave Meile (acting as corresponding secretary for STdNet)

4063. UUPC

Newsgroup: comp.sys.atari.st
Date: 1988-05-27 21:29:09 UTC
From: koreth@ssyx.ucsc.edu
Message-ID: <3488@saturn.ucsc.edu>
Source record: 252113

Has anyone gotten UUPC to compile and run successfully under Laser C? I am having lots of problems. The instructions don't make the proper directory structure to set up very clear; I *think* I have everything compiled correctly. When my ST dials up the UNIX system, it handshakes with uucico for a second or so then just sits there doing nothing. Anyone care to help? Respond by email if possible.

-Steven Grimm

4064. Help on Selling my system

Newsgroup: comp.sys.atari.st
Date: 1988-05-27 21:39:36 UTC
From: bohica%centauri@Sun.COM
Message-ID: <54787@sun.uucp>
Source record: 252114

I've had an Atari 1040ST system for a number of years now,
and I'd like to sell it. I need suggestions for places to
advertise (I am told that selling on the net is not kosher).
I live in the San Fransico Bay Area, so it would be nice to
do it locally.

Are there user's groups, BBS, magazines that would be good
for forums for this?

I've got a ton of stuff with my system; color & mono monitors,
Magic Sac, Megamax C, Beckmeyer MT-Cshell, Cambridge Lisp,
Hard Disk, etc. I've had the system about 3 years. What are
the going rates for this stuff?

Any help would be appreciated. Please send comments directly
to me unless they are of a general nature.

Thanks,

-Tom

4065. Beta release TOS et al

Newsgroup: comp.sys.atari.st

From: good@atari.UUCP
Message-ID: <1065@atari.UUCP>
Source record: 252115

BETA RELEASE OF NEW TOS AND HD UTILITIES FOR ST/MEGA

THIS IS *NOT* A SOLICITATION FOR BETA TEST SITES! IT IS THE FULFILMENT OF AN EARLIER PROMISE TO PUBLISH THE STATUS OF THE NEW PRODUCTS.

The Beta shipments of the new ST/Mega TOS went out to Atari subsidiaries this week. Some have even arrived already. Beta versions of the new Hard Disk utilities and a disk "cache" program were included. The entire kit consisted of the following:

TOS ROM set, configured for local keyboard and American text.
Diskette (D/S) containing:
RAM loadable image of TOS, same configuration as ROM
Disk cache program "CACHExxx"
HDX Hard Disk utility, HINSTALL and associated programs
Product Tracking System front-end program "SPRgen"
Release Notes for:
TOS
CACHExxx
HDX, HINSTALL etc (modified to 30/60MB hard disks)
Draft User Manual for HDX, HINSTALL etc.
User guide for Product Tracking System
Various programs, files and tools to assist in translation

Each subsidiary has been invited to select a small set of Beta sites, and has been requested to ensure that each such site accepts, in writing, certain terms and conditions, including:
no copies to be made
products and documentation are prerelease and without warranty
all communications are to be made solely to the Atari subsidiary, and not through public channels
all copies and documentation to be returned to Atari subsidiary on demand
weekly report indicating name(s) of tester(s), tests performed, observations to be filed with Atari subsidiary each Friday
any bug reports to be first verified against the currently released hardware/firmware, to ensure problem is with new TOS

We want to know what works as well as what doesn't work. A report of "no problems" is worthless if it is not accompanied by an explanation of what testing has been performed. If a program fails, it is critical that it be tested with other RELEASED configurations, so that it is very clear whether or not the failure is attributable solely to the new TOS.

In our testing we have found MANY ill-behaved programs which fail because they appear to access beyond the Mega 4's 4MB RAM limit. I believe they

are accessing "just beyond" where they are supposed to, and it's only on the Mega 4 where they run out of physical address space rather than physical memory. Almost all programs which fail this way have been retested on the current TOS and fail in a similar way.

This beta release is not the final one. Programs should not be modified to look for the date encoded in this version.

PLEASE DO *NOT* CONTACT ANYONE IN ATARI R&D TO SUPPORT THIS BETA TEST. ALL ENQUIRIES SHOULD BE DIRECTED TO THE TECHNICAL MANAGER OF THE APPROPRIATE ATARI SUBSIDIARY, OR TO JOE FERRARI (408-745-2010) IN THE USA. The R&D group must now address the port of TOS to revised and new hardware platforms, and so I would appreciate your NOT disrupting the development activity. We have support groups in place, and they MUST be your first line of support if development of new products is to continue at optimum speed.

A summary of the major improvements to TOS follows:

Floppy formatting is "more compatible" with IBM-PC format
A file may be moved (i.e. copy/delete) in one operation
File Copy/Delete/Move can be interrupted with "undo"
GEM programs can be autobooted from disk
If a name conflict occurs during a file copy, Copy/Skip/Quit are allowed
A folder may be renamed via "Show Info"
The static file allocation limit of 400 is removed; limited now by free memory
"Show/Print File" are completely rewritten
File copying on a single floppy system uses all available memory for buffers
"wind_update(FALSE)" is set when recovering from an application crash
All date separators are now "/"
File Selector has had major rework:
16 drive buttons
Application can send a "title" string to FSEL
FSEL now takes first <RETURN> on pathname edit as end-of-edit
FSEL remembers where it was in a file list
Static file allocation of 100 files is removed
Long pathnames and "ABORT/CONTINUE" now handled correctly
Preserves current DTA buffer addresses, clip rectangles and
default directories
New bindings available
"appl_init" returns version 0130 in global(0)
Editable fields may now be followed by non-editable characters in dialog boxes
"wind_get()" with field parameter WF_SCREEN returns address/length of AES
menu/alert buffer
"Ptsin" (VDI) allows 512 vertices (true since 4/22/87)
"vqt_extent": Pixel errors on some 270 degree rotations are fixed
"vq_mouse" reliability enhanced
40-folder bug alleviated to the point of improbability. A folder only takes up space when "active". Limited now by depth of folders and the accumulated depth of open files. FOLDRxxx still available.
"Malloc" restriction of 20 blocks/process lifted.
FAT searching code for floppy and hard-disk is MUCH faster

Sector buffering greatly improved, and "CACHExxx" allows expansion
"Frename" can now rename a folder
Archive bit (0x20) fully supported
Time stamps for "." and ".." are now correct
"Fsettime/Fsetdate" match BIOS and GEMDOS values
"Fdatime" input value byteswap fixed
Major improvements to "Ccon*" and redirection in general
OS Pool reduced to same size as 11/20/85 ROMs (pre Mega). This may allow
some programs which fail on Mega ROMs to work again.
Soft Reset available from Keyboard if using standard keyboard handler.
Soft reset by CTRL/ALT/DEL
Cold Boot clears all available memory (CTRL/ALT/right SHFT/DEL)
"Rsconf(-2,-1,-1,-1,-1,-1) returns last baud rate value set by Rsconf
Structure of the reserved part of DTA has changed, and remains reserved
Improvements made to detection of media change

THE ABOVE IS A SUBSET OF THE ENHANCEMENTS MADE. THERE ARE MANY MORE, FULLY
DOCUMENTED IN THE RELEASE NOTES SENT TO EACH SUBSIDIARY.

Roy J. Good

4069. re: RGB to composite video

Newsgroup: comp.sys.atari.st
Date: 1988-05-28 16:19:17 UTC
From: Robert_Lisowski@rubbs1.UUCP
Message-ID: <55.229FB0C4@rubbs1.UUCP>
Source record: 252119

The Motorola MC1377 RGB to PAL/NTSC converter chip is the basis for alot of the converters out there. The only problem is creating composite sync (needed by this chip) from the ST's seperate sync. The national semiconductor MM5321N (rather expensive at $11.95, versus under $3. for the motorola) is a TV camera sync generator that outputs equalized pulse composite sync that can drive the motorola. The sync can be pulled off seperately from the ST and input to the national chip's reset pins. The national

chip also has index pulses for field storage applications. I have built alot of video equipment (genlock, composite converters, field storage etc.) that interfaces with the ST.

Practical Solutions is now (?) selling their Video Key, which is a composite converter for the ST. It goes for about $120.

Motorola app note # AN932 describes the use of the MC1377 chip in a circuit. The chip is in the linear databook.

Just got this from GENIE:

BETA RELEASE OF NEW TOS AND HD UTILITIES FOR ST/MEGA

THIS IS *NOT* A SOLICITATION FOR BETA TEST SITES! IT IS THE
FULFILMENT OF AN EARLIER PROMISE TO PUBLISH THE STATUS OF THE NEW
PRODUCTS.

The Beta shipments of the new ST/Mega TOS went out to Atari
subsidiaries this week. Some have even arrived already. Beta versions
of the new Hard Disk utilities and a disk "cache" program were
included. The entire kit consisted of the following:

TOS ROM set, configured for local keyboard and American text.
Diskette (D/S) containing:
RAM loadable image of TOS, same configuration as ROM
Disk cache program "CACHExxx"
HDX Hard Disk utility, HINSTALL and associated programs
Product Tracking System front-end program "SPRgen"
Release Notes for:
TOS
CACHExxx
HDX, HINSTALL etc (modified to 30/60MB hard disks)
Draft User Manual for HDX, HINSTALL etc.
User guide for Product Tracking System
Various programs, files and tools to assist in translation

Each subsidiary has been invited to select a small set of Beta
sites, and has been requested to ensure that each such site accepts, in
writing, certain terms and conditions, including:
no copies to be made
products and documentation are prerelease and without
warranty
all communications are to be made solely to the Atari
subsidiary, and not through public channels
all copies and documentation to be returned to Atari
subsidiary on demand
weekly report indicating name(s) of tester(s), tests
performed, observations to be filed with Atari subsidiary
each Friday
any bug reports to be first verified against the currently
released hardware/firmware, to ensure problem is with new
TOS

We want to know what works as well as what doesn't work. A report of
"no problems" is worthless if it is not accompanied by an explanation

of what testing has been performed. If a program fails, it is critical that it be tested with other RELEASED configurations, so that it is very clear whether or not the failure is attributable solely to the new TOS.

In our testing we have found MANY ill-behaved programs which fail because they appear to access beyond the Mega 4's 4MB RAM limit. I believe they are accessing "just beyond" where they are supposed to, and it's only on the Mega 4 where they run out of physical address space rather than physical memory. Almost all programs which fail this way have been retested on the current TOS and fail in a similar way.

This beta release is not the final one. Programs should not be modified to look for the date encoded in this version.

PLEASE DO *NOT* CONTACT ANYONE IN ATARI R&D TO SUPPORT THIS BETA TEST. 4073. Re: Batch processing from GEM desktop?

Newsgroup: comp.sys.atari.st
Date: 1988-05-29 00:38:02 UTC
From: darin_wayrynen@pedro.UUCP
Message-ID: <238@pedro.UUCP>
Source record: 252123

There are several public domain shell programs that accept batch files. To get a batch file to work from the desktop you would have to install the application
in the install application part of the desktop. Then when you double click on the shell's batch file the desktop will automatically run the shell and then the
shell would load the batch file and execute it.

How's the weather in Corvallis? I miss it since I left two months ago! :-(

4074. Re: RS-232 & MWC: Help....

From: Thomas_E_Zerucha@cup.portal.com
Message-ID: <6029@cup.portal.com>
Source record: 252124

>See if any characters are in the buffers...
I don't know of any completely portable way to do this, so I would suggest isolation to a subroutine. On the ST, the standard way is to use the XBios function Iorec to get the address of the input and output buffers for the RS 232 drivers and compare the head and tail pointers to see if there is anything in the buffer.

4075. Re: VIDEFX3D for Amiga; Atari equivalent?

Newsgroup: comp.sys.atari.st
Date: 1988-05-29 02:09:31 UTC
From: Thomas_E_Zerucha@cup.portal.com
Message-ID: <6030@cup.portal.com>
Source record: 252125

You can check out Cyber Studio from Antic. For about $350 you can get the three pieces - Cad 3d 2.0, Cyberpaint, and a motion control accessory. Antic produced a video using this and it looks very impressive - and it does not degrade too much using a TV, but might be harder to edit. But it will do the things you are asking about.

4076. Consumer Electronics Show this month?

Newsgroup: comp.sys.atari.st

Please forgive the wide range and distribution; I'm running short on time and want to hit as many people as possible.

I've seen mention several times hither and yon, of "... the Consumer Electronics Show (CES) in Chicago this month (June)..." but no further data. Can someone please tell me WHEN and WHERE this thing is taking place? I've been wanting to get to one for years and this looks like my first decent "shot at it."

Any info on FUTURE CES's would also be appreciated.

Include any and all info on fees, ticketing (?), parking, qualification for attendance (can ANYBODY just walk in, or what?) etc. etc...

Thanks in advance. I don't read all the newsgroups this is posted to, so please E-mail instead of, or in addition to, posting a followup.

4077. Posting of UN*X software to comp.sources.atari.st

Newsgroup: comp.sys.atari.st
Date: 1988-05-29 23:48:21 UTC
From: poole@forty2.UUCP
Message-ID: <305@forty2.UUCP>
Source record: 252127

This is NOT intended as flame of anybody, in particular not of the moderator of comp.sources/binaries.atari.st. This posting is prompted by the posting of rzsz (the UN*X version of zmodem) to comp.sources.atari.st.

I propose that we adopt a policy of not posting software that does not run on the Atari ST to the Atari binaries and sources groups, in particular no software that has previously posted to comp.sources.unix and comp.sources.misc.

Reasons:

- it's a real waste of resources (something the various IBM-PC groups really excell in, I don't think we have to copy all brain-damage from them....)

- most sites that receive netnews and run UN*X, archive comp.sources.unix and comp.sources.misc locally. If you are missing a program, or it's simply not installed at your site, what about asking the person that is taking care of News at your place?

- comp.sources.unix is archived at various public accessible sites. There is no problem accessing archives from BITNET and 'ARPANET' sites. The regular introduction to comp.sources.unix lists all archives.

- if a program is useful and a up to date version hasn't been posted for a long time, you should arrange that it gets posted to one of the major sources groups, so that a maximum of people will profit.

In article <1065@atari.UUCP> good@atari.UUCP (Roy Good) described the new TOS ROMs.

The upper case warnings fairly blew my hair back. These new ROMs sound brilliant. This is what we've been waiting for! Keep up the good work.
Any rough estimate as to when they are likely to be generally availiable?
(Some nice cool water after all those flames :-)

4079. Re: File handle info

Newsgroup: comp.sys.atari.st
Date: 1988-05-30 08:56:49 UTC
From: piet@ruuinf.UUCP
Message-ID: <465@ruuinf.UUCP>
Source record: 252129

I got a few mail replies on my question regarding where a file resides.
Some experimenting and combining the answers gave me a simple way to find
out if a file is on disk or a `terminal':

what I think is the easiest way to do it: if you seek to an illegal
position (like -1), you get an error (-64) if the file is on disk,
otherwise you get 0. If the file is on disk, its position is not changed,
so the operation is effectively always a no-op. So I use:

```
isatty (fd)
int fd;
{ return (Fseek (-1L, fd, 0) == 0); }
```

Please could any of the TOS developers comment on this?

Okay. By now, you've probably gotten spit upon by every soul in
netland that worked through school and has an axe to grind, Bunky.
Well, there's an alternative. Why do you want to go through school?
To get a job, right? To either make a lot of money or help humanity.
I'll assume that if you wanted to make a lot of money, you'd have
been asking for loans from folks over the net and offering a fair
interest rate. But you didn't, so I'll assume you want to help
humanity (or are so incredibly stupid that you didn't even think of
the personal loan route). And, we'll assume, that you didn't ever
hear of the disk jockey in Texas or the guy in the New York Times
or the dozens of others who tried the "Send your dollars now" scam
and got $K's. Okay, here's how you do it. You go down to, oh, any
major pedestrian traffic intersection and BEG. I've lived in some
major cities, and have seen it work famously. If a job isn't your
cup of tea, just be honest with people on the street. Tell them
you have no disabilities, no disadvantages, have been going to college
for several years and have no intention of performing any extreme
physical or mental labor ever (I'm assuming this is your story, now).
Maybe someone with the same background will stroll by ("look, Mumsy,
a poor chap with clean fingernails is -- 'sweating'!! I'll give him
some money! Would you like my Bentley for the weekend, Fellow?")
There is a downside to this, though, assuming you don't get your head
batted around by someone who'd read the net around now when you
graduate. You might get hired by someone.

Yeah, right.
This is a SCAM!!!! Do not send anything to this guy.

Why?
1. Nowhere in this posting is the poster's name mentioned. Jay-Jay WHO????
2. I've seen this done before by some radio station DJ... "just send me $20
for no particular reason" and the guy received a significant amount of
money.
3. What organization is this guy from????
4. Mailing address....just a PO box??? I want to see your home address.
5. What college can't you afford? I cannot believe a college would kick you out
just because you have the potental of not paying your tuition.

If this is a legit plea for money, I challenage the poster to answer the above
questions. Please note that it is a federal offense to use the post office for
fraudulant purposes.

Sorry for taking up your valuable disk space, folks, but stuff like this just
makes me sick to the stomach.

4083. ST-UNIX sh.prg

Newsgroup: comp.sys.atari.st
Date: 1988-05-30 19:25:09 UTC
From: cochrane@spot.Colorado.EDU
Message-ID: <6383@sigi.Colorado.EDU>
Source record: 252133

Has anyone figured out how to use sh in the newly posted ST-UNIX
utilities (comp.binaries.st) by Andrew Smith and Steve Ashcroft.
The main problems I'm having with it are:

1. I can't seem to set PATH to multiple paths, i.e.:
PATH=a:\bin:b:\bin
It only finds files if the path is a single directory
i.e.: PATH=b:\bin

2. I can't get it to read and execute a shell script; if I
type something like: cmdfl
where "cmdfl" is a shell script which is either in
the current directory or in the (single directory)
path, sh will reply:
cmdfl not found
It will execute commands such as for, if, while
interactively. (It will also execute *.prg or
*.tos files with no problem.)

Has anyone been able to get this to work; or if it's a bug, has anyone
been able to figure out some other way to do it? It seems strange that
it would have these problems since these are two of the most important
functions performed by the Bourne shell. Also if anyone has been able
to get it to read in its environmental variables upon startup, I would
appreciate hearing about how that's done too.

Thanks for any help or suggestions on this.

Jim Cochrane

>I have been reading about all these horrible viruses and have been concerned
>about my system. What happens if a virus gets onto your hard disk?

So far, none of the virus programs I've encountered attack a hard disk.
that doesn't mean that they won't, eventually. The only thing you can do is
back up your hard disk frequently, and be careful of new software. Be
especially careful of anything you receive on a disk (From friends, user
groups, P/D distributors, etc.) You should keep one known-to-be-clean
disk around, and always have that disk in your drive when you power the
system up or press reset. And keep your disks in write protect mode
unless you have to write to them.

>I have heard of a program called penicilin -- where does one obtain it?

I posted it here a few weeks ago. It is also on GEnie and Compuserve.

>I would appreciate it if someone could send some anti viral programs
>to the net.
> Pat Coffey

Patience, please. The new one is about 48 hours from being posted. I just
have to get the monochrome version working, and get someone else to test it.
I think it does everything just dandy, but I wrote it, so I'm not too
objective. It attempts to be a useable tool for anyone with an ST. You
don't have to know how a disk is utilized, how a virus works, or even
what a virus is to use the new program. It will detect the virus programs
I've received so far, warn you if they are present, warn you if there is
a virus working in your system when the program is running, clean up disks,
and everything else I could think of. So far, though, the automatic
fix-dinner-and-get-me-a-cold-beer subroutine keeps crashing :^).

I too am having the same problems, i.e. it will not source script files, will not set path properly, and there seems to be no way to source a file on startup. It also crashes frequently (usually after a cd, two bombs). The utilities (as far as I have seen) seem to work fine. The toolkit on the whole has much potential, but without a working shell it's virtually useless. Can someone (authors?) please straighten out this mess?

>John Altendorf ...!hplabs!hp-pcd!jma

Check out 'Neodesk' from Gribnif Software...an alternative desktop that totally replaces the existing one. It handles batch files among many other things (and I mean MANY other things). It's most obvious drawback is that it eats up approximately 145K but it covers enough ground that you would most likely be able to eliminate most of your accessories. I own the program but cannot give you much detail on the batch file function because I haven't had enough time lately to take a good look at it..

Good luck, Martin Zyla mzyla@dasys1.UUCP
.

Gauntlet has been out on the ST and is a VERY good version of the arcade game. I especially like the way the sound was done. It was digitized from the video game, so your Atari sounds quite unlike the usual. Rolling Thunder is also in the process of being released (sike!), I think by a European software group.

Good! I hate being flamed. :-)

>This posting is prompted
>by the posting of rzsz (the UN*X version of zmodem) to comp.sources.
>atari.st.
>
>I propose that we adopt a policy of not posting software that does not
>run on the Atari ST to the Atari binaries and sources groups, in
>particular no software that has previously posted to comp.sources.unix
>and comp.sources.misc.

The version of rzsz that was posted to comp.sources.atari.st is (according
to the submitter) a greatly modified version of the software. The original
author did not want to make the hacked-up version an "official" release, but
gave his permission to distribute the program as a companion to the Atari
zmdm program. Apparently the program was posted to comp.sources.atari.st
once before (before I became moderator) so there is some precedent.

I agree that in most cases, UNIX programs should be bounced to the appropriate
group, and I will do so. I thought that this case was an exception.

>GDOS?? Also, I am using the right approach??

I'll give my recommendations, but remember as with everything else, there is
always more than one way to do it, and this is nothing more than an opinion.

The safest way to solve portability is to NOT assume UNIX style TTY I/O
exists and provide your own TTY interface ("glue") routines. For example,
create a set of routines as follows:

open_line
read_line
write_line
ctrl_line
...etc...

Make the library provide the fundmental functionality necessary for
your application. Then put the system dependencies in one place,
isolated from the rest of the application code. The reason I
recommend this instead of assuming UNIX style TTY I/O is two fold:
1) you may want to port to a non-UNIX system where the UNIX calls don't
work someday, and 2) the TTY I/O control calls aren't the same even between
the various flavors and versions of UNIX.

Now for the Atari ST specific stuff... Depending on the level of control
needed, the BIOS calls may actually be preferable to BDOS (GEMDOS) calls.
If you need more control than these provide, you may have to write your
own interrupt and RS-232 device handlers (e.g. to toggle RS-232 control
lines). Another reason BIOS calls might be better are performance;
they're slightly faster than the BDOS (Caux?? calls use the BIOS Bcon??
calls eventually). The disadvantage to using the BIOS calls is that the
software then becomes more hardware dependent because it is assuming hardware
device 1 is the RS-232, and there is nothing else connectted there (e.g.
a MUX or network).

With RTX, the cleanest way to get both BIOS level speed and flexibility and BDOS device selection flexibiloity is to open the device by name, using a run-time selectable device name, and then use the RTX Ftype call to get the BIOS level device number at run-time. This also means that custom device drivers can be installed supporting the device control operations (e.g. toggling RS-232 control lines) at the driver level.

So in summary, you define a device independent I/O library. Then you use ST calls (probably BIOS, maybe BDOS) to write a ST specific version of the library. When you port to another system, you simply write a new "glue" module, using that system's best RS-232 calls.

Hope this is somewhat informative.

4096. Re: HINSTALL

Newsgroup: comp.sys.atari.st
Date: 1988-05-31 19:30:44 UTC
From: braner@batcomputer.tn.cornell.edu
Message-ID: <5016@batcomputer.tn.cornell.edu>
Source record: 252146

[]

Finally, HINSTALL (the official Atari boot-from-hard-disk utility)
has been posted on comp.binaries.atari.st.

Questions: I am now using HDB 2.3 for the same purpose. Is there
any reason to replace it with HINSTALL? If I want to replace it,
how do I get rid of what HDB left in the master boot sector on the
HD? Just deactivating HDB through itself does NOT restore the disk
to its former state before first installing HDB. I once tried to
install the Supra HD booter over HDB and ended up having to reformat
the HD. One (ugly but feasible) solution is to overwrite the
master boot sector, or the relevant parts of it, with the image
of a freshly-formatted (and partitioned the same way as before)
HD boot sector. Alas, I forgot to save such an image before I
installed HDB. Anybody care to post such, perhaps with comments
on what's where on that sector (partition information especially) ?

4097. Aztec C for the ST

Newsgroup: comp.sys.atari.st
Date: 1988-05-31 20:46:24 UTC
From: nowlin@ihuxy.ATT.COM
Message-ID: <2542@ihuxy.ATT.COM>
Source record: 252147

I recently purchased Aztec C for the Atari ST from MANX Software Systems under a 30 day money back guarantee. Unfortunately, I sent it back. The following is part of a letter I sent to MANX Software Systems on May 29th. I left out the part about my good experiences with their CP/M and MS-DOS versions of Aztec C and the part about them shipping me an empty disk in the first place and the lack of speed with which they corrected that problem. This posting refers strictly to the technical problems I had with their Atari ST C compiler. I thought it might keep some people from making the same mistake I did. I waited almost two years for this product and I was very disappointed.

==========

Problem 1.

Yesterday I finally had time to take a look at Aztec C for the Atari ST. First I scanned the documentation again (remember I'd had it for three weeks already) and installed it on my hard disk. Then I used the example from section 3.3, page Tut.6 of the tutorial to compile a simple hello world program. Unfortunately when I tried "cc hello" all I got was a temporary file and no ".o" file. I read the compile section of the document in detail and could see no reason why I shouldn't have gotten a ".o" file but I eventually tried using the "-t" option to create a ".asm" file and then used the assembler to explicitly create a ".o" file. I was then able to use the linker to get an executable that worked, almost.

Problem 2.

I included a statement in my hello world that printed one line to standard error (stderr) in order to see how your buffering would effect the order of output and if redirection would be supported independently for the two standard output streams. Your manual talks about stderr in a couple of places. Section 2.1 of the library chapter mentions stderr as one of the three "preopened files" and in section 3.3 it is mentioned as the only stream to be unbuffered by default. I could not get the standard error output to show up anywhere. I had no problem with standard out when used implicitly with a simple printf() or explicitly with a fprintf(stdout,). Standard error is sadly missing.

Problems 3. (the clincher)

I then went on from a simple hello world program to a more complicated version of the standard UNIX where(1) command that I have working in Alcyon, Lattice, and Megamax. When I tried to compile it in Aztec I got two very disturbing undefined symbols from the linker. It couldn't find xbios() or gemdos(). I tried linking with all the libraries that came with the Aztec system but no luck. Then I checked the standard osbind.h header

to see how they got around this problem and discovered that Aztec has decided that the library routine names that all the other C compilers have found acceptable weren't good enough. They had to use different ones. Since different osbind.h headers have been the source of several bugs in the past I have coded my programs with direct library calls to avoid problems between different versions of osbind.h. Now you come along and decide to make even the library routine names different.
==========

Since it took me a total of about two hours to uncover this many problems I returned my copy of Aztec C and don't intend to bother with any MANX products from now on. Has anyone else purchased Aztec C for their ST yet? I'd be interested in different (opposing) opinions.

I had a little luck using msh and mt-csh style paths, separated
by comments rather than colons... I also used MemFile! to edit the
executable to get rid of the 'D:' drive specifier. That helped.

> 2. I can't get it to read and execute a shell script; if I
> type something like: cmdfl
> where "cmdfl" is a shell script which is either in
> the current directory or in the (single directory)
> path, sh will reply:
I was trying to get it to de-shar some files with no success. This
is essentially all I want sh for, and it won't work for me, either.
It seems to bomb on comment lines, too...

My intention is to order the sources for it as soon as the stuff I
ordered form Beckemeyer comes through, then work on it in my (hah!)
spare time. I think I'd like a bourne shell just to de-shar things.
Other than that, it should be a fun way to figure out how to use
SDS. Some of the utils are things I actually didn't get with MWC
or MT C-shell, but most of them are already here.

> otherwise you get 0. If the file is on disk, its position is not changed,
> so the operation is effectively always a no-op.

That may be an easy way to do it, but I wouldn't recommend relying on
an undocumented feature of what Fseek returns. Hardly safe.

The approved method of determining isatty is to save your current
position in the file, seek to 1 byte from the beginning, then restore
your current position. If the seek to 1 byte from the beginning
returns 1, you're not a tty. It involves a couple more seeks, but
it's safer:

int isatty(fd)
int fd;
{
long savepos;
long seekret;

savepos = Fseek(0L,fd,1); /* save where we are */
seekret = Fseek(1L,fd,0); /* seek to 1 byte from beginning */
Fseek(savepos,fd,0); /* then back to where we were */
return (seekret != 1L); /* if the seek didn't work, it's a tty */
}

We have about +20 1040's here @ AU; I have the only colour monitor. The rationale for getting it (besides "Ross likes toys") was that nobody had one, and what was it like? Also, to try writing stuff that would work properly on both types of monitors.

The dealer I usually work through when purchasing stuff also seems to mostly sell mono systems - the price difference seems to be part of it, and also the fact that they are the kind of Atari dealer who also sell Un*x boxes, and know whereof they speak when they do sell them. Don't see many atari dealers like that, though - most try to sell me games (yawn).

>A while ago someone posted a description of how a ram-disk using this
>connector works.

There are two possible solutions:
- hack the hardware (I like this one!).
If you generate your own DTACK, the Glue will not issue a BUSERR.
BUSERR seems to be the output of a monoflop retriggered by Adress Strobe
(right , Atari?).
Disadvantage: Hmm, if you hack the hardware already, why use the
cartridge port?

- WRIT by READING. When you read the adress range of the cartridge
port, an Adress is passed to the outside.
Use the low part of the adress (LSByte) to put the data out (to a latch,
latched by Chip Select). Forget the read value.
Works well.
I took this from a german magazine (c't). They do graet hardware
hacks...

4106. null fill eliminated

Newsgroup: comp.sys.atari.st
Date: 1988-06-01 06:58:11 UTC
From: leo@philmds.UUCP
Message-ID: <490@philmds.UUCP>
Source record: 252157

Remember the discussion about the slow null filling routine TOS uses after loading a program? Here's a nice small, fast and, what you hackers will like most, dirty piece of code I made yesterday evening. It just eliminates the null fill (there could be a 1/(vbls/sec) delay %-) and is guaranteed NOT to work on all ROM versions 8-).
The main problem will be the addresses (start, end) of the fill-routine in ROM. If you know them, you can substitute them (fillhigh and filllow). I don't have other ROM's or disassemblies. Maybe someone else can pop up a more general solution?
The central function is fastload, that checks if the PC is the critical region; if so, D5 will be given a big value on return from the VBL interrupt, which causes the fill routine to end.
The search for a zero VBL pointer starts at the queue address + 4, because I suspect some program (maybe it's GEM) to write a vector at queue_address[0], no matter what is already there. Now fastload.prg can be put into the AUTO folder.

```

> they do not use buffers.

Yes, the BIOS aux: port routines are buffered. The default buffers
are quite small, about 700 bytes if I remember correctly, but adequate
for 1200 baud. You'll probably want more like 2K if you're going to
use 2400 baud a lot. The function to change the buffers is Iorec (on
page 350 of the 2.1.7 manual). Remember to save the old buffer
information and restore it before your program exits. I wrote a
simple vt52 emulator that sets up 8K input and output buffers, it runs
fine at 19200 baud.

> .... I would like to write this BBS so that it doesn't
> use too many system dependent functions. Is there any way I can access the

> GDOS?? Also, I am using the right approach??

The way to do this, as always, is to ISOLATE the machine-dependant
functions. Write a series of functions for talking to the serial
port, like 'getichar', 'putochar', etc. Handle EOF in any manner that
seems reasonable. Then when you move your BBS to another system, just
re-write 'getichar', 'putochar', etc.

cc probably stands for a compile and link utility. You needed to say
"cc -c hello.c" to get a hello.o out of the compiler(just like UNIXtm) .
I have seen their product on the Mac and that is how it acts.
"cc hello.c" will compiler and link, removing the object file.

>>Problem 2.
>>I included a statement in my hello world that printed one line to standard
>>error (stderr) in order to see how your buffering would effect the order of

I don't think there is a STDERR on the ST, so I wouldn't expect it to work.
It should probably just go to STDOUT.

>>Problems 3. (the clincher)

I don't know what's going on here.

4111. Gulam and Toolkit

Newsgroup: comp.sys.atari.st
Date: 1988-06-01 19:26:20 UTC
From: ljdickey@water.waterloo.edu
Message-ID: <1604@water.waterloo.edu>
Source record: 252161

To newsgroup comp.sys.atari.st
Distribution: uw

I received, yesterday, the latest copy of Gulam. I have "bundled" it with some ".g" files the doc file, and the help file using ARC, have uuencoded it, and copied it to two places:

watmath:/tmp/gulam.uue
water:/tmp/gulam.uue

I also recently downloaded the Toolkit posted by Andy Smith of Kings College London. I tried some things like "date" and "wc" with Gulam and they seem to be compatible with Gulam.

Smith and his friend have also done "SH", the Bourne shell, so if you prefer that, it is there. My preference is to pick and choose from the Smith set to complete the Gulam shell.

If you want to borrow it, I can loan you the disk, or I could put it into a tmp file for a while.

>
>The utilities (as far as I have seen) seem to work fine. The toolkit on the
>whole has much potential, but without a working shell it's virtually useless.

I agree.
I think that the Gulam shell works well with these utilities, and
has the flexibility that allows you to make your environment the way
you like it... aliases, sets, scripts, prompt, and so on. I found
that I prefer "more14" to the one built in to Gulam, so I use that.

I found that in the Toolkit by Andrew Smith and Steve Ashcroft,
there are some things that I am interested in. I have not tried all of
them yet, but I intend to. I will pick out things that I like, give
them an alias in the Gulam shell, and use them.

There are several people who are doing great work to make the ST
a more productive environment in which to work:

The four who come to the top of my list are

Prabhaker Mateti and Jwahar Bammi, both of
Case Western Reserve University in Cleveland Ohio

Andrew Smith and Steve Ashcroft, both (I think) of
Kings College, University of London.

Some of you may not have not heard much from Mr. Bammi recently...
I think (hope) he is writing his thesis.

Others who are among my favorites are

Moshe Braner (RAMDISK, IDLE12, SCACHE)
Tod Burkey (DISKSCAN)
Jean-Pierre Dumas (UUD, UUE)
Houston club? (DCCLOCK)
Simon Poole (UNITERM)
Roland Waldi (VOL)
George Woodside (TURTLE, PENICILN)

From article <490@philmds.UUCP>, by leo@philmds.UUCP (Leo de Wit):
> null fill (there could be a 1/(vbls/sec) delay %-) and is guaranteed NOT to
> work on all ROM versions 8-).
> The main problem will be the addresses (start, end) of the fill-routine
> in ROM.

This is appalling! Please get over the idea that you can fool with stuff in ROM. For starters, some programs EXPECT that the whole heap (not just the declared BSS) is zeroed at startup... Microsoft Write is one. Maybe the disk cache you use, or the hard disk compaction utility, or something equally deadly expects this -- and you'll learn the hard way not to fool with this kind of thing.

I know the clearing takes a long time on 11/20 ROMs. It's much faster in Mega and future ROMs. But it's still there, because it is a "settled expectation" among developers. ("Settled expectations" are things that people count on despite the fact that nobody promised they'd stay true.)

I urge people not to use this trick or any other which changes the environment that programs execute in, or depends so heavily on actual addresses in ROM.

I'm having some problems converting 1st_word files to WordPerfect with
the utility that WordPerfect provided in the last release (convert.prg).
It seems that it doesn't convert special charaters, like accents and
umlaut's. Has anyone run into this problem ? Are there any fixes ?

I have noticed a few programs lately that have made use of ".rsc" files. These programs sometimes have with them a second program which is used to "CONFIGURE" the resource file.

Sometimes these resource files use a clever encoding scheme that compresses an already small quantity of information into as few bits as possible. Maybe even getting everything into a small number of bytes.

In some instances, this strikes me as ludicrous, since it seems that every file takes a minimum of 1K anyway. Why not store the desired information in "cleartext", perhaps even with a few keywords, and allow the user use an editor to create and/or modify the input data file?

That may be an easy way to do it, but I wouldn't recommend relying on
an undocumented feature of what Fseek returns. Hardly safe.

I agree. So, *WHAT* is the documented return value from Fseek, especially
in the case I use. I never saw any description of Fseek telling what the
return code (except in case of an error) is. Is the return code you use
(the actual position in the file, 0 for a non-file) documented?

In fact if it is documented to ALWAYS return 0 on a terminal, then my code
is reliable.

I beg to disagree. Gauntlet, in general, is a vastly overrated game which is basically the old 'Zombies' game (you know, nasties that home in on you by simple X-your X, Y-your Y algorithm) with a bit of shooting and magic potions thrown in.
Gauntlet on the Atari ST was a DISASTER. The sound effects were so poorly digitised that you couldn't tell and the SCROLLING...well, no comment.
Although I think Gauntlet is a complete and utter waste of time, try Garrison or Garrison II on the Amiga to see what a PROPER conversion should look like (and even Garrison is extremely boring - not even the Amiga can enliven what was a dud game concept to start with).

From: ralph@lasso.UUCP
Message-ID: <8806021054.AA07856@lasso.laas.fr>
Source record: 252170

I have recently received Gulam v.1.03.05.05 from netlib@lakesys (thanks for the service!) and in that version I found a bug that wasn't in the beta-test version:

mv can destroy files!!!! without any message whatsoever.

I found this problem when I was moving files from my hard disk to a reasonably full floppy disk. After the move, the floppy had zero space left and *all* the files were deleted from the hard disk. The problem is that not all the files made it to the floppy!! SO BEWARE!!!

The beta-test version (1.00....) did not have this bug. Mv would abort when the disk is full, and the files not *completely* transferred are deleted.

By the way, when will Gulam accept foreign language keyboards without one having to hack the GULAM.PRG file? I still think that it's the best shell around! Keep up the good work.

As always, I don't yet (;-{) receive any of the newsgroups -- so reply directly to me. Thanks.

I've been doing this long enough to have tried "-c". No soap. Even if
"-c" worked, the Aztec tutorial should have had it documented correctly.
I get real tired of documents with examples that have obviously never been
tried by anyone. It reminds me of the joke:

Q: How many tech writers does it take to screw in a light bulb?
A: Just one, if there's a programmer around to explain it.

PLEASE don't include examples in manuals without someone trying them!

> >>Problem 2.
> >>I included a statement in my hello world that printed one line to standard
> >>error (stderr) in order to see how your buffering would effect the order of
>
> I don't think there is a STDERR on the ST, so I wouldn't expect it to work.
> It should probably just go to STDOUT.

The point is, if there is no stderr on the ST then they shouldn't have
referred to it in their documentation at all other than to state that
stderr wouldn't work. If there was stderr and it was the same as stdout
their documentation should have stated that. Their document was a great
example of misinformation when it came to stderr.

By the way, I had to kludge stdio.h to work around a problem with stderr on
either my first version of Megamax C or Lattice C or both. That's why I
tried an example using stderr on Aztec C in the first place.

From: greg@bilbo
Message-ID: <278@snjsn1.SJ.ATE.SLB.COM>
Source record: 252172

Congratulations. I'm tempted to say "It's about time", but I won't because that would spoil the intented positive tone of this letter. This is *exactly* the sort of evidence I was looking for from Atari to indicate that there is in fact something real in the way of support for existing machines.

It sounds like Atari has taken to heart the complaints and suggestions of its customers, and done something really significant with them. I am looking forward to getting this new version of TOS into my machine.

On that subject, Roy, do you know what the timetable is predicted to be for the end of beta test to release, and how this will be released to current owners? This information will be important to many people in order to decide whether to start new projects now, and possibly have to make changes later, or simply wait until the update is in hand.

Congratulations again, and keep it up!

But, in many cases, these resource files are created with a resource
editor, and the use has no control over the internal format. Although
I haven't needed to create one, I believe there is a standard way to
lay out a GEM resource file. It contains a tree structure describing
the GEM data the program will used, such as dialogue boxes, menus,
etc.

4126. Vertical Scrolling

Newsgroup: comp.sys.atari.st
Date: 1988-06-03 03:45:45 UTC
From: jpdres13@usl-pc.UUCP
Message-ID: <1423@usl-pc.UUCP>
Source record: 252175

I remember someone a while back mentioned that you could do vertical scrolling by using Setscreen() in increments of 256 bytes. I have gotten the scrolling to work, however, I had to use 256*5 or 1280 byte increments in low rez in order to have the screen line up the left edge correctly.

Not surprisingly, for 32000 bytes I had to increment 25 times to do the whole screen. Funny how that is the EXACT number of lines on screen for low and med rez! I think that I have stumbled over a real fast way to do text scrolling! Anyone out there tried this yet?

On a final note, I can only assume that the 256 byte increment will align the screen correctly only in mono. And since my mono monitor is on the fritz ... can anyone tell me if the 256 byte increment will line up correctly in mono?

4127. Re: null fill eliminated

Newsgroup: comp.sys.atari.st
Date: 1988-06-03 09:54:28 UTC
From: leo@philmds.UUCP
Message-ID: <491@philmds.UUCP>
Source record: 252178

Here are some small corrections for the fast loader I put on the net this week.
1) There is a header for the module now. It says:

```
* Even when loading from ramdisk or harddisk the ROM program null fills all
* uninitialized data, heap, stack (often the major part of your RAM).
* This null filler makes loading programs faster. Its null filling is 7 times
* as fast as the ROM's, using the quick movem.l instruction. Besides it only
* clears the BSS space.
* At least the fillhigh and filllow addresses have to be adapted to suit your
* ROM version.
```

2) The bigint definition should read:

```
bigint equ $7ffffff0
```

3) I abandoned the idea of no null filling at all. Some programs generated
bus errors when started with this VBL routine active, so I've looked things
up in K & R. In paragraph 4.9 (Initialization):
...In the absence of explicit initialization, external and static variables
are guaranteed to be initialized to zero; ...
So the routine now clears the BSS space; the programs that generated errors
now work OK. The null filling is performed by null filling chunks of 128
bytes using movem.l instructions; that seems to be the fastest way, especially
if you move many registers at a time. The 'modulo 128' part is cleared first,
at the top of the BSS. Here it is (I have left the initialization routine out):

```
fastload
movea.l 74(sp),a0 * PC
cmpa.l #fillhigh,a0
bhi.s fastdone
cmpa.l #filllow,a0
blt.s fastdone
lea.l 32(sp),a0 * Address D5 on stack
cmp.l #bigint,(a0)
bge.s fastdone * Already filled
move.l #bigint,(a0) * Maximize D5 on stack
move.l 68(sp),a6 * Value of A6 on stack to A6
move.l -4(a6),a4 * Start of block to fill
move.l -58(a6),d0 * # bytes to fill: BSS size
move.l d0,d1
and.w #$7f,d1 * d1 = d0 & 0x7f
moveq.l #0,d2
lea.l (a4,d0.l),a5 * End (one past)
bra.s fastl1
fastl0

4128. Getting Back Into The ST World

Newsgroup: comp.sys.atari.st
Date: 1988-06-03 13:56:35 UTC
From: jca@homxc.UUCP
Message-ID: <2310@homxc.UUCP>
Source record: 252179

Hi,

I've had an 1040ST for awhile but really haven't had time to
used it too much. I now have some free time so I pulled it out
of the closet and it booted up just fine.

Anyway, the last time I used it, almost a year ago, there was talk
about Atari releasing an updated OS, blitter chip, 4-Meg upgrade,
and stuff like that. Did any of this stuff ever get released?
I sent in all the registration cards when I purchased my 1040ST
and would assume (am I nuts!) Atari would keep me informed of new
product releases and such. Well, to this day I've haven't received
anything from Atari. The question is did I miss any major updates?
If so, how would I go about getting my machine updated?
I'm in good shape with the software I purchased for the machine
since I kept upgrading the packages when the vendors sent me
their upgrade offers. My only problem is the ST itself.

Also, which are the latest mags for the ST computes. I sent
in a sub. card to STart last year but never received anything.
Now I can't even find a St mag anywhere. Any recommendation?

Thanks In Advance,

John

Regarding the MIDI problem, I have been writing MIDI timers et al and
I was getting a problem like that right after I switched to a MEGA. It
turned out to be a bad ACAI chip. However, it may not be so, if you
have other commercial MIDI software that works. Assuming you use the
XBTIMER, mif you are doing any string maintenance on the string you want
to output, you should disable the interrupt while you do that stuff, so
it doesnt kealeave any pointers lying around. I assume you are using the
Midiws call. If not, I wouldnt know what the problem is. There is a MIDI
developer's forum on Hybrid Art's bulletin board, and if you have any questions
they are usually very helpful.

In article <278@forty2.UUCP>, poole@forty2.UUCP (Simon Poole) replies:
% This is the correct behaviour (I just rechecked on this terminal, an original
% VT100)......

Exactly right. I'd be upset if it didn't work this; the first line in
my login.com file on every VMS account I have is:

$ cls :== set terminal /width=80

to clear the screen. It doesn't work on some cheap VT100 clones, like
the C. Itoh CIT-101.

->the files were deleted from the hard disk. The problem is that not all the
->files made it to the floppy!! SO BEWARE!!!
->

this is definitely a bug but...(and thanx for pointing it out!)

i don't know about you, but if i'm going to backup something to floppy and
then delete it (essentially mv) i ALWAYS cp, confirm that the copy worked with
(at a minimum) ls -l or (more thoroghly) cmp or diff (if really critical) and
only then do i rm the files, on any system, from a pc on up to a cray. it's
just not worth the headache if something should go wrong. in fact for very
important stuff, make 2 copies (i know, i'm just too paranoid...).

do you know if 1.03 has pipes? this is one essential feature lacking in an
otherwise great program (i played with MWC msh v1.x and immediately decide
gulam was infinitely better..except for pipes in which case i could just
start msh under gulam for the one command and exit but this is painful).

even being able to do this would be nice:

alias pipe " > pipetmp0.000 ; \!2-$ <pipetmp0.000 ; rm pipetmp0.000"

then (say)

history pipe grep ls

but this does not work (alas). i should see if this works under BSD csh...

->example of misinformation when it came to stderr.
->

good points about bad docs. its a shame because i, too, have been waiting
to see just how good this compiler would be. sounds like it needs some work
yet. i guess i'll stick with good 'ol alcyon (maybe slow but it works...)
if the problem is just cc, there are several cc programs (w/src) available
(i wrote my own way back when) which could be converted. but it sounds like
the libraries are brain damaged and that's just too much of a hassle to fix,
even with say dlibs. i'm tired of hacking at system software just to get it
to work the way it should (i.e. reasonably close to un*x).

> decided that the library routine names that all the other C compilers have
> found acceptable weren't good enough.

I had Problem 1, too, until I thought about what CC has to do. It has to Pexec the assembler. To do that it has to FIND the assembler. If you weren't running under Gulam, or if you didn't set your PATH correctly, it couldn't find the assembler and left you with the temp file. Took me about five minutes to establish that this was in fact the problem and correct for it (by editing gulam.g for the right directories).

Problem 3 is in the same vein: any compiler product has to make the assumption that you are in its environment, including using the macros and libraries that came with it. If you don't, you can't blame the compiler for the results. Macros and libraries are tightly bound. If I try to use MWC-specific stuff under Megamax C, it won't work either. The osbind.h macro names are the same, of course: they're the Atari-published OS call names.

One legitimate beef about Aztec C is that its CC isn't clever enough to start the linker, and the linker is too clever -- it includes the runtime startup code by magic. I would rather have less magic in the linker and more magic in CC. Also, CC should complain that it can't find the assembler, rather than failing silently.

Finally, I would like to point out that Aztec C does more dhrystones per second than any other compiler for the ST that I tested:

Compiler Mode NOREG REG

MINIX CC 522 522
AZTEC C 3.6 32 bit large 772 830
AZTEC C 3.6 32 bit small 779 837
ALCYON 4.14 847 859
Megamax 2.0 874 919
MWC 2.0 996 1042
AZTEC C 3.6 16 bit large 1058 1128
Megamax 1.0 1063 1136

AZTEC C 3.6 16 bit small 1070 1142

These were all using the dhrystone source from Usenet (version 1.1,
dated 01/31/87 from 01/06/86 from 12/01/84, by Reinhold P. Weicker,
Rick Richardson, with results solicited by pcrat!rick).

>no random function in the program that could explain this.
> [rest of message deleted]

Which method do you use writing the notes to the MIDI port? It seems you're not using the standard way, because you explicitly say: one at a time.
The xbios call, Midiws (xbios 12), lets you write a complete string to the MIDI port. Note that's not a C-style string: you must supply a count (number of bytes to send minus one; a 2-byte integer) and the start address. The random function you spoke of could be the value of the start pointer on the stack if you thought this function had only one parameter X-). Hope this helps?

Leo (the high C).

Why not make it an official then? "Settled expectations" are a hell of a way
to make programming specs. All of the programming languages say don't count
on space in the heap being zero or variables being set to any value before
being init'ed.

>
>John Altendorf

Some reactions on John's question involved creating a batch file processing program, something like BATCH.TTP and using the Install Application from the Desktop to mark .BAT files as to be read and interpreted by BATCH.TTP. I think a good batch file processor should also provide for parameter substitution (like the $1, $2, $* etc. parameters of the shell, or %1 from MS-DOS). It would have been nice if the Desktop supplied the arguments line itself for the parameters (seeing that a .TTP program was involved), but this is not the case (I think because you already have the batch file name as a first argument for the batch program). Perhaps the BATCH.TTP should scan the batch file for positional parameters and supply an arguments line to be filled in by the user if it had any.

Leo.

4141. disk drive data disaster

Newsgroup: comp.sys.atari.st
Date: 1988-06-04 18:59:37 UTC
From: jsd@UMass.BITNET.UUCP
Message-ID: <880604145635254.ALFX@Mars.UCC.UMass.EDU>
Source record: 252191

My disk drive has recently began acting very oddly - I kept getting
a lot of "data on the disk in drive a: has been damaged" alerts
so I tried backing up the files and reformatting the disks - most of
them came out useless. Figuring dirty heads were the problem, I bought
a floppy drive cleaner and gave it a spin. The problem has lessened,
but I still occasionally get these alerts. Usually when writing new
files they appear. It's driving me nuts not being able to trust my disks.
I've had this drive (an SF314) for over a year and it hasn't acted up
at all in that time. Has anyone experienced similar problems?
Reply E-Mail please, or to the net if you can't reach me. If I get
any interesting advice, I'll post a follow up.

4142. "Bob"???????

Newsgroup: comp.sys.atari.st
Date: 1988-06-04 20:40:42 UTC
From: wilmott@topaz.rutgers.edu.UUCP
Message-ID: <Jun.4.16.40.40.1988.7450@topaz.rutgers.edu>
Source record: 252192

Just discovered something interesting the other day, and am curious...

In one of our school papers here at Rutgers, there's usually
ads/comments/references to an organization in Texas known as the
Church of the SubGenius. Their emblem/logo is a smiling man with
a pipe in his mouth who is known as "Bob Dobbs", or just "Bob".
The other day I found that this same picture of "Bob" is part of
the built in character set on the ST! To see "Bob", go into 40 column
low res mode, enter Basic, and:
print chr$(28);chr$(29)
print chr$(30);chr$(31)

Anybody have any info about how "Bob" got into the ST? Were it's
designers members of the Church of the SubGenius? Or was this picture
originally from something else entirely, and just happened to adopted
by that organization???????

Curiously,

Ray Wilmott

Message-ID: <880604213835.862173@HIS-PHOENIX-MULTICS.ARPA>
Source record: 252193

Someone recently posted saying that SS disks are not good to be used as DS disks. I own a 1040 ST (with DS disk drives), and I don't own one DS disk. I format my SS disks for DS use. I have owned my Atari for a year now (I bought it May 3, one year ago) and I haven't had any problems with losing data, however in that time I have had to have my heads alinged twice, could this be a side efect of using SS disks for a DS drive?

> Is it true that computer brand X uses one side of a SS disk, while > computer brand Y uses the other side?

(My two cents)

I was told (by my dealer) the only difference between SS and DS disks is that the manufacturer dosen't check the second side of the disk, but the are still put together the same. If this is true, I find it hard to believe that one computer would store data on one side of the disk, while another computer stores it on the other side, when only one side has been certified.

Aric Friesen

P.S.

Someone gave me two brand new unopened Nashua disks, and one wouldn't format. That means 50% of the Nashua disks that I own didn't format. I also have heard similar complaints from Mac owners, in other words, I wouldn't recommend buying Nashua disks.

I have never needed a clipboard file (I find that I basically use my ramdisk as a clipboard) on the mac or Atari (or any other computer I have used!). However, there is a clipboard program (available on Genie, and probably other places) that lets you install a clipboard on your ST. I downloaded it, but havn't used it yet so I can't comment.

Source record: 252195

J.A.Cisek writes

>...The sound (on the ST) really stinks

I must admit, that as far as programming sound, it does sound pretty bad (but Dr. T's and ST replay are pretty amazing!). I used to program on a 1200XL, and I programmed some games. I always used sound in my games, and it was easy to create explosion sounds, and other assorted sound effects. I don't use sound in the games I program on the ST, because it doesn't sound good. I have not been able to program any GOOD sound effects (and I've never seen (ok heard :-)) a program (PD or other) that has good sounding explosions, lasers, ect.)

>Go into an arcade and HEAR some of the new games.

I posted about a week ago about games on the ST, and pointed out the fact that Blasteroids in the arcade has amazing sound and graphics, and that I wasn't even sure that it could be well cloned on teh ST. The only way I could see it having high enough resolution for the game, would be in mono mode, and then it wouldn't have any colors :-(...wait...sorry I was getting of the subject there.

One last thing, I still havn't fully figured out how to play music indipendently of the program,(Hey!! that's mustitasking!! Who says the ST dosn't have multitasking?!?!?! :-)but I really don't think (considering the sound (at least the sound *I* get out of an ST) isn't very good) that it is worth it.

Aric Friesen

P.S.

I tried to make this letter as confusing as possable by adding a lot of parenthases, I hope I secceded :-)

P.P.S.

If anyone (especially who uses GFA Basic) has succeded in getting some good sounding sound effects, I would like some info. on how you did it.

Source record: 252197

I just found out that Laser printers have already been outdone. Now companies are starting to produce liquid crystal printers. They print at the same resolution (300 DPI), but are more reliable, and less expensive. They are said to be more reliable because they don't require the use of precision optics. They are supposed to be cheaper to make because they don't use expensive optics, they don't have precision optics to be precisly installed, and they have less parts.(although they are the same price as a laser printer now, because they just have been released)

A laser printer uses a laser to draw an image on a photosensative "plate" or sensor, this sensor then tells the printer what to print. This setup, however, requires precision optics and lasers.

The liquid crystal system has a liquid crystal shutter over the sensor plate, and by sending light through the shutter when it has set-up for what needs to be printed, the sensor plate can pic-up the image and print it.

Okay you asked for it! People have been saying that the Amiga is better than the Atari, and although I usually don't get involved with these wars and they usually drive me crazy, I have to join in here.

The scientific outlook about the computers

First there was the Macintosh, really the first icon/mouse based microcomputer. From that evolved the Amiga and ST. As you probable know, the way things evolve is by mutations, well the ST was a good mutation, but the Amiga was a BAD one. Now your probably saying, "Well, then why hasn't natural selection made the Amiga extinct?" That is because that it takes a long time for natural selection to get rid of the BAD mutations.

If you are religious, this is the explanation for YOU!!!

God decided to award the good people with Macintoshes, so he created that computer. He then decided too many people had them, and that the REALLY good people needed an even BETTER computer, so he created the ST. He also felt that some BAD people should be punished by having a BAD computer, so he created the Amiga as a means of punishment!

I own a Quadram Quadjet printer, and am wondering if there are any printer drivers for it, for use with a wordprocessor such as First Word, or if I could get info. on how to make a printer driver. I also would like to know how I can get my printer to print screen dumps, and how I can get it to print Spectrum 512 color pictures.

Any help is greatly appreciated.

I was just talking to my local Atari dealer, and he said that he had ordered the drives and expected them any time.

I learned something, though, that bothers me. I was planning on buying on of these floppy drives that stores 10 megs on a 5 1/4 floppy and using it as a hard drive (I don't own a hard disk now). I was told that they arn't very reliable for storing and restroing data however, and that they should only be used to backup hard disk systems.
Can anyone comment???

Answers greatly appreciated

Here is a summary of some software I have been using, and how I like it.

Test Drive (game)--excelent, you can drive a Corvette, Ferrari, Lotus,
Porsche 911, or Lamborghini. Just like Amiga
version, except without the errors.

Flash (terminal program)--excelent, this program is great, it has
programable features for automatically
calling, uploding, etc. It has a nice text
editor. Lots more!

Supra Modem (2400 baud)--excellent, low priced, is 'Hayes' compatable

ST-Replay (audio digitizer)--Those guys from Microdeal/Michtron/GFA
have done it again. Excelent audio
digitizer. I recorded the "Mr. Ed" theme
song and played it backwards and
disproved the theory that it is satanic.
Excellent sound, and optional output for
hooking it up to a stereo system (no
stereo output though).

Cyber Paint--good, needs
1. 512 color support
2. fill patterns
3. user-definable fill patterns
4. better text features
5. better line features (such as arrow ends, and
dotted lines)
(I guess I'll have to break down and buy Spectrum)
other wise it's pretty good.

CAD 3-D--good, needs
1. 512 color support
2. math co-processor (it's too slow!)
3. better drawing tools (I've heard Cyber Control
takes care of this, but I don't want to deal with
another programming language!)
other wise it's OK.

GFA Basic--Yes I program in basic!--this is an excellent program, it
dosn't use line numbers so your programs are more structured,
it is very fast, and has a nice compiler, ect. ect...
I love this package!

ProCopy--(allows you to copy copy protected software)--It is very
nice, the only problem I've had was that it wouldn't copy

Test Drive because it uses a new copy protection, I will have
to wait for the next version of ProCopy to come out.

Stereo Tek Liquid Crystal Glasses--****EXCELLENT***
WoW!!!!!! these are great!!!!!!!
The effect (I use them with CAD
3-D) is like having a holographic
screen. The pictures really do
look like holograms!!! In two
hours I made a simple anamation
of the USS Enterprise rotating on
its x,y,and z axis, while it
hovers over my keyboard because it
comes out of the screen!!!!!!
CAD 3-D isn't the same without
them!!!

Brain Holmes asked what the three different screen resolutions on the ST are.

Well, according to documentation, low res offers 320,200 (I think according to most books) however, I have found that the resolution is only 319,200 (any comments?). In med res, it is supposed to be 640,200 (I haven't used many graphics commands in medium res, so I don't know if this is correct). In High res it is supposed to be 640,400 (I haven't experimented with this because I don't have a mono chrome monitor).

Any comments why the ST dosn't have the resolution it should (note: the experimenting I have done was with GFA Basic).

I'm here (I don't like the sun much--not a big fan of skin cancer). I think that the particular system we are on is having trouble hooking up with the nets. All of the other areas are stale as well. We'll have to wait for Mr. Keyles to do something. I hear all sorts of horror stories lately about the net problems (backbone not working right, cities and whole chunks of the country being cut off from everyone else). I can't wait for the distribution system to be transferred to satellite transponders (set up 3 zones with multiline 800 numbers for the nets to call at 9600 baud, the zones transfer all the messages [and you could have PD files too] to a central office via satellite, and the central office distributes all over the hemisphere in one shot--everybody gets the broadcast in parallel!). Won't cost much either-- sat. transponders can be rented for a half hour, and that's all it takes to do all of this. With the prices of receivers coming down, each net could have a small dish and receiver for a few hundred dollars. Telephones could be used for coordinating transmissions and handling problems like nets that didn't get yesterday's stuff--so transmit an addendum for the particular net etc...

Some nets use variations of this theme already. The Fido coordinators should take a look at this message and see about upgrading. I don't know where or who they are, so if anyone does, wake 'em up and show 'em this message.

That's enough rambling for now. Hope to see this netnews section going again soon. See ya, STeve.

Rob [1:107/330] (I know, folks, that's my Fido adress)

P.S.--Netnews coordinator--This message pertains to all nets and all computers, but I don't have a better place to put it (no "net.sys.satellite" area), so leave it here. I got mail once for posting an "inappropriate" message in a netnews area (not related directly to the subject--not obscene or anything). People will see it here. I'm mainly interested in what the Atari users think about this subject.(!)

It looks like the MINIX ST people will get stuck with as poor
a compiler as the PC people did.

MJC 2.0 (Mark Johnson's shareware C compiler) does 950 Dhrystones (NOREG)
with version 2 Dhrystone. Does anyone have a Dhrystone 2 figure for one of
the above compilers so I can scale the MJC result to Dhrystone 1?

I'd really like to see the Dhrystone results from GCC on an 8 Mhz 68000,
does anyone have them?

> In fact if it is documented to ALWAYS return 0 on a terminal, then my code
> is reliable.

According to the GEMDOS manual, Fseek "returns the current, absolute position in the file." If there is an error, Fseek should return an error code. It is not documented to always return 0 on a terminal. The method I posted is taken directly from the TOS release notes for the latest version of TOS, and it will be making its way to developers via the developer newsletter soon. In fact, I believe this method originally came from David Parsons and was posted on the net some time ago (sorry, I can't seem to find David's address at the moment).

If you use the approved isatty, you won't lose.

Cross-posted to: comp.sys.atari.st,comp.sys.atari.8bit

Greetings from Chicago!

I really hate to do this to you all but here are the cold hard
facts.

1) This year the CES was geared strictly for games. (:<)

2) There were no new software packages displayed for the ST line.

3) As of Sunday, the second day of the show, the attendance was about half
of what it had been in years past. (The show is a loser)

Now for some interesting tidbits......

The UN*X box will not be introduced until next year. The marketing
strategy goes something like this:
"If we introduce the Unix box now we will probably not sell another MEGA
and we have lots of those around."

The PC has to go through a redesign. It seems that with all of the
functions that were put on the mother board, the assembly plant could not get
the insertion machines to work on the densely populated boards.

There is a new development package for the 2600 and 7800 machines.
It consists of an assembler and rom emulator. The system utilizes an ST.

Other than that there is not really anything else new. I will be able
to tell more after the annual CLAUG/Atari roast dinner.

later,

Rich Andrews

Aric,
I think you do not need a dish. Mike Gore, here in Waterloo,
is collecting images from satelites with a less expensive antenna. He
has a low priced scanner from Radio Shack and a small circuit that he
has designed himself. He then stores the images in (i think)
neo-chrome format, adjusts the gray scales, and then prints them on the
printer. Maybe he will tell you about it. For me, his address is
magore@watcgl.

Yes, indeed. A fellow here in Waterloo has done so, and will be giving
a talk about it at this week's GTIA/Vector II meeting. (Small plug,
there.) He built the antenna for his receiver, and the decoding
electronics, and feeds the data into the ST for analysis and printing.
He recently posted some articles to one of the science newsgroups,
but I don't recall which one. Sorry.

LCD printers have been around for about 6 - 8 months now. There are two currently available. There was a review of the both of them in Byte magazine in the April or May issue. They were a little unflattering.
The main problems with them are threefold: They offer no cost avantages over Laser Printers, they are based on the Ricoh engine and neither support Postscript, which I consider a necessity if you are going to spend this kind of money.
Another burgeoning technology to be paying attention to is Bubble jet technology. Canon has supposed made a real breakthrough, and will be introducing new models later this year. We are talking 300+ dpi resolution (possibly in color), for less than a thousand dollars.

4168. Timeworks Desktop Publisher ST

Newsgroup: comp.sys.atari.st
Date: 1988-06-07 00:00:27 UTC
From: rowley@ORVILLE.NAS.NASA.GOV
Message-ID: <8806070000.AA29777@orville.nas.nasa.gov>
Source record: 252068

I got a demo of Timeworks Desktop Publisher ST this weekend.

Page layout is done with four tools: a tool to create and manipulate text and image boxes, a tool to enter and modify the characters and character styles of text, a tool to do simple object-oriented drawing, and a tool to manipulate the justification and spacing of text. Switching from one tool to another seems to bring in a new overlay from disk. The user interface to the program is slick. There is on-line help.

Text can be imported from a number of standard word processor formats, and graphics can be imported in formats including Easy Draw, Degas, .IMG, and Neochrome files. Images can be resized once they are imported, and images are not distorted by resizing them a number of times. Text flows between collumns and pages. Style sheets can easily be created, saved, and loaded.

The program uses GDOS and comes with six fonts. A large number of output devices are supported, including Postscript printers, FX-80, 24-pin, Atari laser printer, and some other laser printers.

The price at HT Electronics was $110 for this package. At this price, the package sets a new standard for desktop publishing on any computer.

> scan the batch file for positional parameters and supply an arguments line
> to be filled in by the user if it had any.
>
> Leo.

Jefferson Software put out a program called RUN with version 1.0 of the JS Modula system that did just that. Its companion program "COMMAND" could be used with it for a simple batch facility from the desktop. RUN prompted for a command line when it was run. It also set up the environment, etc, from parameters supplied in the file that launched it (a *.RUN file).

I haven't heard of anyone using it extensively, but it seems to me that program would be a very simple way to accomplish flag and environment setting to do things from the desktop. When I was working on JS Modula V1.0 libraries I used RUN extensively, it made development on a stock 520ST considerably less painful ;-).

Ugh. More UNIX weenies trying to determine our future.

"I guess it's better than having them pump quarters in Pac-Man games...
" - John C. Dvorak

Not always! Sometimes computer companies listen to them and lose their shirts (e.g. Fortune Systems).

It's 1988 and UNIX still S*cks. GEM ain't the greatest, and I'd rather have X, but I have to have a brain-damaged operating system that's older RT-11, for pity's sake! No thanks, I'll pass.

Besides it usually isn't GEM; it's usually TOS. Yes, TOS is awful. Can you say "CP/M with fender flares"? I knew you could. But UNIX is even worse... (Hmm, you'd never know I'm a VMS person, would you :-)
"UNIX compatibility is snake oil."

4173. Renaming Folders

Newsgroup: comp.sys.atari.st
Date: 1988-06-08 09:23:56 UTC
From: neil@hwcs.UUCP
Message-ID: <1867@brahma.cs.hw.ac.uk>
Source record: 252073

I have a folder 'ALCYON.C' on the HD here at work but I don't think Gulam
likes it because of the '.'. So today I decided to rename it by editing the
sector containing the directory entry (STOP!! No don't do it I hear you cry).

I suucessfully found the sector and changed the trailing 'C' into a space
($20) since that is what other folder entries had. But it didn't work.
Every time I tried to open that folder I was dumped back on the root of
the partition. Why? I tried a few different names like 'ALCYON_C', 'DEVKITCC'
and 'ALCYONCC.DRI' and they all gave the same result. Only the original name
would yeild the correct result ie. a working folder.

A 32 byte directory entry looks like this:-
(I am relating this from the GEMDOS reference manual)

```
8 Character primary name
/
/ 3 Character extension
/ /
_____________________/ ______/ Attribute byte
/ \ / \ /
00 01 02 03 04 05 06 07 08 09 0A 0B 0C 0D 0E 0F

10 11 12 13 14 15 16 17 18 19 1A 1B 1C 1D 1E 1F
\___/ \___/ \___/ \_________/
\ \ \ \
\ \ \ File length
\ \ \
\ \ Starting cluster
\ \
\ Creation date
\
\
Creation time
```

All I changed was the name and extension. Nothing else. I hope the new ROM
Frename does a better job renaming folders than I did. I have since restored
the original folder name and its OK again. But I would like an explanation
as to what went wrong. Is there more to renaming a folder than just changing
its name?

"I think all right thinking people in this country are sick and tired of being
told that ordinary decent people are fed up in this country with being sick and
tired. I'm certainly not and I'm sick and tired of being told that I am!"

From: t19@nikhefh.hep.nl
Message-ID: <470@nikhefh.hep.nl>
Source record: 252074

Does anyone have a PD kermit which accepts its arguments from a commandline?
I'd like to be able to do a partial backup during lunch and I already own a
highly intelligent shell that can figure out which files to send (in fact,
the best shell available for the ST in my humble opinion: pipes, ``, case,
foreach, built-in resizable ramdisk, cache, local variables, unix-style
patterns as in e aap[1-5], arithmetic @ i++, VAX-like arrow commandline editing,
^d, filename completion with fignore, ...)
For some odd reason I cannot get zmodem to work reliably to our mainframe
so I'd prefer to use kermit.

Many thanks,
G.J. van Oldenborgh

I just bought an Okidata Microline 292 Color Dot Matrix Printer for my PC at work. I would like to try the following. Display a graphics image of some sort on my 520ST at home. Dump the image to a file. Upload the file to the UNIX mainframe I use at work. Download the file from UNIX to my AT&T PC6312 (IBM AT Compatible) at work. Dump the image to my color printer. According to the docs that came with Moshe Braner's BARREL program, I can use BARREL to do just that. Has anyone tried this? Moshe, have you? If I receive no responses I'll just try it myself. Any suggestions or comments are greatly appreciated.

> Rolling Thunder, I Robot, Dragon Spirit, Gauntlet and Gauntlet II,
> Major Havoc, APB, et. al.

The UK software houses are very fond of arcade conversions at the moment
(some of which have actually made it to the market). I thought the
games fanatics out there might like a list of what to look out for !

Below is a list of arcade conversions either availbable now or under
development for the ST by UK software houses. I've probably left a
number of titles out, this is all from memory but I think I've got
the publishers right !

Some of the comments have been "gleaned" from various UK ST and
Games magazines.

First the actual arcade conversions:

Title Publisher Notes

Roadrunner US Gold - Now available in a
Indianna Jones " - 4 game compilation
Gauntlet " -
Metrocross " -

Rampage Activision

Buggy boy Elite Getting good reviews

Road Blasters Activision ? Under development

Xenon Melbourne House ARCADE QUALITY vertical scroller

Sidewinder Melbourne House " " " " (easier
than Xenon)

Roadwars Melbourne House Difficult to describe ! Good graphics
Gameplay not great.

Gauntlet 2 US Gold Just out. 4-PLAYER with adaptor.

Space Harrier Elite Under deleopment ? Things seem to
have gone quiet on this. Early reports
were interesting. 8 bit versions
have been out for over a year.

Star Wars Domark Good conversion, maybe a little slow.

Empire Strikes Back Domark Under development.

Return of Jedi Domark Under development ? For Xmas.

Rolling Thunder US Gold ? Just out. Competemt conversion.

Slap Fight Ocean Average Conversion.

Ikari Warriors Elite Average Conversion.

Outrun US Gold Good Conversion.

Bubble Bobble Firebird Good Conversion.

Bionic Commandos US Gold Under development.

Halls of Kairos US Gold Under development. Sold as "Desolator".

Alien Syndrome The Edge Status unknown ?

Darius ?? A company had a Darius machine on
display at last years PCW show. Nothing
has been mentioned since.

There's also a few original games that may be worth getting:

The Last Ninja System 3 Under development (for a looong time!).

Return to Genesis Firebird Smooth horizontal, parallax, scroller.

Leathernecks Microdeal 4 Player.

Whirlygig Firebird Under development. Screen shots
look good.

Black Lamp Firebird Good platform game.

Backlash Novagen 16 bit version of Encounter (on the
8 bit and C64). Mindless blasting.
Its great !

Damocles Novagen Under development. Sequel to Mecenary.
Graphics are completely different.
Gameplay ?

Captain Blood Infogrammes Recent release from a French company.
English language version just out.
Space exploration. Great graphics,
good sound. Takes some time to get
into it !

Carrier Command Firebird Wow ! Combat/war game with arcade/
Flight simulator graphics. Solid
filled 3-D graphics. Animation is
very smooth.

Virus Firebird This is the game used to "sell" the
Acorn Archimedes - difficult to

describe. Byte carried a screen
shot in a news item about the
Archimedes. Reports of the conversion
are very favourable.

Starglider 2 Firebird Under development. Should be ready
"soon". Firebird have started to
advertise it. Graphics are solid,
filled, 3-D. Should be as smooth
as Carrier Command.

I have a mono monitor so have not actually got many of these games,
but I have seen and even played some of those that have been released.

Have fun !

>just the declared BSS) is zeroed at startup... Microsoft Write is one.

I may be coming close to starting a theological argument here. On the other hand, I spent ages, some years ago, in helping users convert IBM/360 applications (where storage was zeroed when you got it) to run on IBM/370 systems (where it wasn't -- or was it the other way round?). Anyway, I was always taught, and since that experience have believed, that you should **NEVER** write a program which depends upon ANYTHING being ANYWHERE in storage, unless it put it there itself -- with the obvious exception, of course, of DEFINED system locations.

So, what I find appalling is that a company like Microsoft (who I generally think highly of) would hire programmers who indulge in writing code that relies on this sort of undocumented effect. If Microsoft Write (or anything else) WANTS an alloc'ed block of storage to contain zeroes, it oughta D**N WELL put them there its-own-self. Period.

>
>
>This is appalling! Please get over the idea that you can fool with stuff
>in ROM. For starters, some programs EXPECT that the whole heap (not
>just the declared BSS) is zeroed at startup... Microsoft Write is one.

Then I think those programs are wrong, in sofar that they depend too
strongly on the environments they work in. A portable C program should never
expect the heap to contain all zeros, although many O.S.'s may do this:
the clearing of pages that for instance Unix applies when a process asks
for more space (more heap by calling sbrk, more stack by pushing data on it),
has nothing to do with initializing, but with protection; that process may
not peek at what another process left there. It could be just as well be set
to all 1's, or 0xe5 (but some Unix boxes have probably fast clear instructions).
When I come to think of it, it is even not very trivial to write a program that
uses that 'zero' feature; let's see, assume we have

```
#define DATASIZE 5000
```
then:

1) first try:

```
char egdata[DATASIZE];
static char sgdata[DATASIZE];
```

but these are not good examples; both are BSS so my fastload also clears them
(according to K&R).

2) second try:

```
function()
{
char adata[DATASIZE];
static char sldata[DATASIZE];

/* code here */
}
```

are also not good examples; sldata is BSS so my fastload also clears it;
adata is on the stack so assuming it contains zeroes is bluntly wrong.

3) third try:

```
function()
{
char *pdata;

pdata = malloc(DATASIZE);
/* code here */
}
```

Wrong again; if the malloc() was preceded by free() you're likely to get
non-zero space; use calloc(), that's a portable way to get cleared space.
The same applies when you use the GEMDOS call Malloc(); it can just as
well contain non-zero space. And so for sbrk() and brk().

Moral: If you know beforehand the size you can use BSS declarations to
get a zero-initialized data element; note that they take no data space in the
program file (or use the initialized data segment by explicitly initializing it
to zero). If you don't, don't rely on some magic undocumented builtin
trick of some O.S. (you can put a T in front) but do it the standard way,
using calloc() for heap and _bzero() or setmem() or repmem() or
zero_it_yourself_mem() for general space clearing; more likely to be portable
and big chance it's faster than the ROM's routines; this goes not for all
parts of it, but some are really badly if at all optimized (but that's another
chapter).

>Maybe the disk cache you use, or the hard disk compaction utility, or
>something equally deadly expects this -- and you'll learn the hard way
>not to fool with this kind of thing.

Maybe the new ROMs have their disk IO reorganized. All disk cache owners
will be surprised then, but not happily 8-). They will learn not to fool
with machines that are so poorly documented (please no flames, this is
merely a plea for better and less terse manuals in the future). I
understand it's easier for Atari not to make any statements regarding
the behaviour of their machines, in order to fix certain problems easier;
but they should understand that in order to get a machine, or perhaps better,
an O.S. accepted, they have to specify a certain standard, whatever that might
be, so that developers can rely on it, have fait in it (this is not a
follow-up to 'What Atari should do' 8-).

>I know the clearing takes a long time on 11/20 ROMs. It's much faster
>in Mega and future ROMs. But it's still there, because it is a "settled
>expectation" among developers. ("Settled expectations" are things that
>people count on despite the fact that nobody promised they'd stay true.)

I don't need to count on it and I wouldn't settle for it %-). Besides I think
it is a pure waste:
On my 520 ST+ with harddisk many of the tools I use take more time to
clear their space than to actually load. My programs and shell scripts run
much faster after this fix and most programs don't use even 10% of the so

slowly cleared space. The editor and compiler that use BSS space amongst others are perfectly happy.

>I urge people not to use this trick or any other which changes the
>environment that programs execute in, or depends so heavily on actual
>addresses in ROM.

Ever taken a look at AHDI.PRG, the hard disk driver that comes with the SH204? This one also uses fixed addresses to check for ROM version etc. I think there's no other way if you want to fix things, or you end up rewriting complete parts of TOS/GEMDOS, and I wouldn't like that. My utility could just as well be extended to settle for more ROM versions, and I would help anyone that wants to find things out for his version. You can also easily modify it to give you all cleared space, if you insist on that; it will still be more than 7 times as fast as what my ROM does.

>==
>Opinions expressed above do not necessarily -- Allan Pratt, Atari Corp.
>reflect those of Atari Corp. or anyone else. ...ames!atari!apratt

Now you're making sense! And I hope my opinions CLEARed things a bit... only the BSS, that will do 8-).

Leo.

4182. FATSPEED WORKS!!!!

Newsgroup: comp.sys.atari.st

Date: 1988-06-09 10:23:51 UTC
From: U641000@HNYKUN11.BITNET
Message-ID: <8806091002.AA03906@ucbvax.Berkeley.EDU>
Source record: 252085

I have had my SH205 hard disc for almost a year, and have been using
it heavily. Here's what happened to me lately.

My SH205 hard disc occasionally gave these "Data on disc C/D/E may be
damaged" messages (in the course of running a program!),
which were easily remedied by switching the drive
off and on (once or twice or thrice). Then one day whilst staring
at an editor screen I noticed my disc coming to life. After exiting
the editor the file I had been editing had grown from 10k to 2M.......
(note: I don't have a MegaST, and my editor (Tempus) calls
it quits well before 800k)
Curiouser and curiouser: I deleted this file, and found that my 4M
partition on the hard disc had 3M used and 3M available. Most files
were found to contain just repetitions of their first 20 or so lines.
Luckily I am paranoid about this sort of thing and had a 3-day old
backup of everything important. (Long live Flashback!!!!!!)

Do people out there have similar experiences?
Are other discs than the Atari more trustworthy?
(Am I doing something wrong? I do switch off the drive when I don't
need it for a while, such as when using Uniterm)

4186. Atari's new mega st system policy

Newsgroup: comp.sys.atari.st
Date: 1988-06-09 12:05:00 UTC
From: wayne@inmet.UUCP
Message-ID: <148900003@inmet>
Source record: 252086

So yesterday I call my local music store where I've seen ST's and
mega ST's displayed, and ask how much for a mega ST ? The guy says
'well we are currently reevaluating whether we will continue to
carry Atari computers'. HHHHmmmmmm, I thought, being used more and
more by musicians and recently announced that Atari was going after
music stores to carry the line......something is fishy here. So I
call another small music store that I know is an Atari dealer and
the guy says 'well, I hate to tell you this, but Atari has just
announced that dealers cannot purchase mega St'
s unless they also purchase an Atari laser printer, so I can't
sell any megas except bundled with their laser printer'
(this is a one man music store.....not a department store).
So, now I understand why the first store is reevaluating its'
dealership.
So I say ' well give me a price on the 2 and 4 meg mega systems
that you are selling just for the hell of it'. He proceeds to
give me a price of just under $4000.00 for the 4 meg which includes
a 20 meg hard disk, the laser printer, and a bunch of software
including VIP professional, and some other 'business' oriented
stuff. The price for a similar package for a 2 meg, no hard disk,
and only one floppy came in at $29xx.xx (don't remember the exact
change'. My response to him was ' gee....if I HAVE to spend $3000.00
I would probably get a Mac SE with a 20 meg hard disk and no
laser printer that I don't want anyway....
his response was 'good point'.
FFFFFFFFLLLLLLLLLLAAAAAAAAMMMMMMMMEEEEEE OOOOOOOONNNNNNNNNN !!!!

I hope you guys at Atari are listening:
First you put out your cute little slogan 'power without the price'.
second you build MIDI ports into the machine....obviously you are
thinking of musicians using it. Third you go out of your way to
court the music industry into really pushing your machine. Fair
enough, it is a good music machine, plenty of music software is
coming out, musicians like it, blah blah blah.
So music stores start carrying it, great. Now memory requirements
are becoming greater for musicians because of large sequencer data,
multiple applications shells, etc.
AND NOW YOU ASSHOLES ARE TRYING TO SHOVE YOUR LASER PRINTER THAT MOST
MUSICIANS DON'T WANT DOWN OUR THROAT.
Don't you understand that music stores are not dept stores ?
They can't afford to buy a laser printer with each system
to have it sit around a fucking storeroom for years. Don't you
understand that it's a great help to musicians to be able to
buy their computer (of CHOICE !!!!) from the music store that they

always deal with ? Don't you understand that you are not going to compete with Apple and increase your prominence in the business world by alienating all of your musician customers and trying to force dealers to force consumers into buying your products ?
And finally, if you as a company were going to make this kind of policy, why all of the energy to court the music stores into becoming dealers......are you guys just fucking crazy or what ?

P.S. I don't work at a music store....this is from the perspective of a past 520st owner and (previously) prospective mega owner. At this point I would spend twice as much on any other computer than buy a mega, purely on principal. I think Atari and whoever dreamed up this little scheme are a bunch of assholes and I think and hope that this little folly puts your asses right out of business.

If the guys at Atari or anyone else has a response to this please post it for all to see. Also my name is Keith Hedger and I'm using the account of a friend of mine.

Is there a norm on the ST for the specification of PATH? The Unix ":" is
out since it separates the drive specification. COMMAND.TOS and GEMBOOT seem
to want a semi-colon ";" as separator. Gulam wants a comma "," and won't
accept anything else. I would appreciate having this defined in ONE place and
have my various shells pick up the proper value. Am I asking too much? ;-|
As always, email me directly since I still don't get the newsgroups, sigh!

> 2) There were no new software packages displayed for the ST line.
>
Not true. I talked to several third party software suppliers and looked at what they had new for the ST. There is plenty new, both entertainment and productive software. Atari chose not to display the ST to any extent, probably because they are emphasizing the ST at COMDEX now. I was disappointed that there was no display of software or hardware for the 8bit computer line, though. No really good reason was given either. A lame excuse, such as "we tend to alternate, one year emphiasing computers and next year the game sytems". This isn't true, because I have been at the CES for the last several years and the computers have always been a part of the show.

> 3) As of Sunday, the second day of the show, the attendance was about half
> of what it had been in years past. (The show is a loser)
>
Maybe, but Saturday was pretty crowded and Monday was also plenty busy for a Monday at the CES. I do think that more of exhibiters are choosing other shows to highlight their wares. The movie software companies had a very small showing except for the "blue" movies. They are using a Video show as their vehicle of choice.

> Other than that there is not really anything else new. I will be able
> to tell more after the annual CLAUG/Atari roast dinner.

> Finally, I would like to point out that Aztec C does more dhrystones per
> second than any other compiler for the ST that I tested:

By the way, when running dhrystone, you should do it on an empty
machine. I was running dclck13 (a clock program that displays the time
in the top right corner of the screen), and just to see how many
cycles it used, I ran dhrystone. Where I normally get 1000, I got 900.
The clock program was using 10% of the machine's power!

Take a look at Steinberg's Pro-24 version 2.1 (or 3.0, if it's out).
I've had it for several months now and in general I've been really
happy with it. Version 3, if it should choose to appear, will let
you record on four tracks at once. The only complaints I have are
about the lousy manuals.

Ha! After months of fighting the buggy code produced by Alcyon, I threw the damned thing away and went over to MWC. I only wished I'd done it earlier, and saved all that trouble.

The major problem with MWC is that there isn't an option to generate code to check for stack overflow (the suggestion in the manual to do it yourself is of course ridiculous), and I almost consider this as buggy code. It's absolutely infuriating to spend 2 days using the debugger, only to discover that you've overrun the stack. Does version 3 fix this, by the way?

Source record: 252092

Sorry, but I don't have the time to reply to the person who asked
about high end MIDI sequencers directly.

You are deciding between two very different sequencers. I originally
bought KCS level II. I didn't like it. It was very hard to crank out
basic material. Step editing was horrible. The manual is not very
well written. In short, I didn't like it, and bought Passport's Master
Tracks Pro, and I am very happy with it.

I have look at C-Lab's Creator, and it looks excellent. Very nicely
done program. In another month or so, however, C-Lab's Notator will
be available. Supposedly it contains ALL of Creator plus a full notation
program. It looked amazing. I think it is available in Europe, so,
if anyone on the net could give further information, all us musicians
would be very appreciative. If the notation part of it is good, go with
Creator because the notation program for KCS (the copyist), lacks in
many ways. It is not very friendly, and is very slow to work with.
A basic transcription of one of my pieces took 3 hours AFTER I had learned
the program. Aside from that, KSC II destroyed one of my pieces for
no reason. Go for Creator, or for Master Tracks Pro....
Any further questions, feel free to write me at UPDIKE@Umass.

Ta,
Damian Roskill

These are all my opinions, Dr. T's, C-Lab, or Passport can flame
me if they want......

P.S. I myself am waiting for Intelligent Music to come out with
Upbeat for the ST, so I can have a Fairlight Page R!

>

On the subject of RAM DISKs, I mean external RAM "DRIVES";

Some of you may remember Glen Stone, and his chip which he called
Stonehenge, well the chip (and a PCB) is real and will be made
available with in 2-3 weeks.

Points of interest;

connects to the dma port (hard disk)

devices can be daisy-chained, i.e. RAM DRIVEs or Hard Drives (your
hard drive must support pass-thru, else put it last)

2Meg with 256K parts, 8Meg with 1M parts

Dwell on this;

Daisy-chain 7 RAM DRIVEs for a total of 56MEG of very fast external
storage.

Comments;

I ran "showpic" on the RAM DRIVE, it was able to display the frames
fast enough for animation.

The RAM DRIVE was sized, formated and installed with the Supra Hard Disk
utilities.

Nity Grity;

The chip, a PCB, and docs will be offered as a kit. A support kit will also
be offered that will include some hard to get parts, like the DB19s,
the PGA socket, maybe the xtal. In addition a power supply will be
made available. Power requirements are 5V at 2A with good transient current
response.

A completely packaged ready to plug in product will be available in 2-3 months.
Watch for the "Maximum STrive"

About 1.5 years ago Antic published a project that would convert
satellite pictures that are rebroadcasted on a VHF channel into
images for your 8bit, they also showed how to connect it to
a ST

The circuit was simple, just one IC, with most of the work being done
in software.

4195. OPS5 in Cambridge LISP posted to comp.sources.atari.st

Newsgroup: comp.sys.atari.st
Date: 1988-06-09 22:48:44 UTC
From: feat@bnlux0.bnl.gov
Message-ID: <562@bnlux0.bnl.gov>
Source record: 252095

The recent posting of the Cambridge LISP version of OPS5 needs two
fixes to at least get it to compile.

1. The definition of PROG1 is broken, try replacing the line

,@(append (cdr l) '((return ,xxx)))))))

with the following line:

,@(cdr l) (return ,var)))))

2. The global *cved-least* should be *cvec-least* in the "fluid"
declarations.

About Cambridge LISP, are people using it? Did everyone give up after
METACOMCO held their $200 for months before shipping last year (like they
did for me)? Have there been new releases? Any applications written in
it other than the OPS5 that was posted?

In <Jun.4.16.40.40.1988.7450@topaz.rutgers.edu> Ray Wilmott writes:

>Anybody have any info about how "Bob" got into the ST? Were it's
>designers members of the Church of the SubGenius? Or was this picture
>originally from something else entirely, and just happened to adopted
>by that organization???????

As the unofficial spokesman for J.R. "Bob" Dobbs on the net, I'll have to put the explanation of this 'phenomena' as follows:

A. It isn't really "Bob", but the evil anti-"Bob". A tool of the dupes of the conspiracy to confuse the followers of "Bob" into doing stupid things. Like for example, the purchasement of a computer known as the Atari ST.

B. The engineers at Atari after sitting back and realizing what they done also realized that they needed a LOT of help. When help's 'a needed', "Bob" is the one to be pleaded. They put the "BobsHead" in as a last ditch effort.

C. It really is one of the few genuine "Bob" miracles. I might add, that this has happened two other times. The "BobsHead" has divined itself to appear on a dinner roll, then later in an unconnected incident, on a flour tortilla. The ST fits perfectly in this class.

D. It isn't really "Bob" or anything like "Bob", but Jack Tramiel smoking a bloated cigar. Actually, I've read something to this effect in an ST magazine.

Although "Bob" hasn't divined what personal computer he owns, if he owns one at all, I tend to suspect that he uses an Amiga. After all, the band "Devo" is a very big part of the Church of The Subgenius. The band members use Amigas... Need I say more?
Second, I would take a 16 color 640x400 picture of "Bob" over a cheap 40 column imitation any day. I might add that when "Bob" is viewed on the Amiga in this resolution, he almost shimmers. You can feel the "slack" being radiated from his image.

The above is not intended to be the match of a fire, but simply an explanation from an unofficial source. I have heard legends of past Amigans being flooded with ST fanatic mail. I do not wish this to happen. However, if you would like me to mail you the glorious image of "Bob" that I described above, I would be more than happy.

"A Read More About It Project" "The Book of The Subgenius," available at finer bookstores everywhere.

In <A Whole Bunch of Messages> Aris Friesen spews a whole lot of garbage:

I don't want to flame you, because you seem to have a very slight realization of reality. I would like to make a few comments though.

A. Blasteroids is done in a 320x200 resolution. It would look like total trash in a monochrome 640x400. It may not be possible to duplicate on an ST, but I do know of another 68000 computer that has animation, color, and sound capabilities to match the arcade game.

B. Test Drive ST is not a "duplicate" of Test Drive Amiga. Although I have not experienced these "errors" you claim are ridden throughout the program, I have experienced these differences. The engines "roar" instead of "buzz", the pictures of the cars "shine" instead of "glimmer." The rest of the game is negotiable. Of course, I have heard people say that the IBM EGA version isn't much better. Overall, it is a lousy game.

4198. Omnires

Newsgroup: comp.sys.atari.st
Date: 1988-06-10 03:05:38 UTC
From: cochrane@spot.Colorado.EDU
Message-ID: <6569@sigi.Colorado.EDU>
Source record: 252098

Is anyone on the net familiar with Omnires or any other mono to color/ color to mono emulators (I'm interested in color emulation with a mono system myself, since that's what I have)? I'd specifically like to know how well the program works - how focused or unfocused lines and text are, speed, realism, accuracy, etc. Omnires is advertised in this Summer's Start for $34.95, which sounds like a good price if it works well.

Thanks for any responses; I think others would be interested in this as well.

Jim Cochrane

4199. MagicSac please!!!

PLEASE!!!
Could someone give me some information about the status of MagicSac???
We would like to buy some of them and need to know a few things in advance:
- what about MEGA-STs ?
- what about HardDisks ?
- what about printer-drivers ?
- What about compatibility with MACs (disks and the like...) ?
Does somebody know a decent dealer who is willing / able to ship
some MagicSacs (professional version, with ROMs, ability to read/write
Mac-disks, etc.) to Germany accepting payment via MasterCard? What are
reasonable prices for all teh stuff? What about update policy? Any
problems known :-) ?

Thank you soo much,
Klaus.

Agrgeed. But I'm a monochrome-only user with the following question: If you draw, say, a circle on a medium-res screen, which dimension defines the radius? The circle would be X pixels wide but X/2 pixels high--an elementary problem that b&w users don't have to worry about!

4201. UniTerm

Source record: 252001

1) Is there soneone who knows how to print or save the UniTerm graphics screen, while the cross-hair is still active? I often use interactive molecular modeling programs, and would like to save the screen at any moment. (Yes, I do have GDOS installed). I only succeed in saving with no cross-hair active (which is a rare occasion in *interactive* graphics programs, isn't it?). Any suggestions?

2) Switching disks while in the disk-utility menu, using the delete-file function (as I did) to see what files where on the disks, destroys the files on the second disk!! I guess that the FAT of the first disk is copied onto the second one, making it appear as if the disks are alike. Fortunately it is possible to restore your files with Moshe Braners *THIN* program; it instructs TOS to not use the first FAT on the disk, but the second one. Thanks a lot, Moshe!

Nice Subject! We use twelve ST's as jack of all trades in our department.

Noud van Kruysbergen has developed a fast timer interrupt routine in
assembler which can easily be used in C. Adaption to GFA Basic is in
progress. The ST is equipped with 4 timers of which the A-timer is free.
The interrupt is executed 10.000 times per second which yields an accuracy
of 0.1 msec. Higher frequencies(=accuracy) can be achieved, but this will
suppress other tasks during timing.
An external timer button can not be connected to the mouse or joystick ports
but has to be linked to a port of which the status is directly readable.
Examples are the printerbusy signal of the parallel printer port or the CTS,
DCD, RI (with the RTS) signals of the serial (RS-232) port. So you need to
adapt, e.g., the RS232 port to use such a routine. The timer can start,
reset and/or read by means of manipulating global variables.

Here are some applications for the ST we use in psychological experiments
and testing in our department.

- Timed presentation of digitized sound samples and tones of variable
duration, volume and frequency:

We use very nice low cost 8 bits AD/DA cartridge hardware and STRACK
software, both distributed in Holland by Atari Club Nederland (ACN)
Haarlem (price app. $ 75). Part of the STRACK software has been patched
in cooperation with the author to provide high quality D/A output via the
cartridge from within GFA Basic. A homebrew Gfa program loads a set of
digitized sounds and a control file containing time, duration and frequency
parameters of tones and sounds. The tones are generated by the internal
sound chip of the ST.
There are two ways to present the sound to subjects. A low quality
presentation is possible via the internal sound chip and speaker (no
cartridge needed during replay). A high quality sound reproduction is
possible via the D/A of the cartridge. We use the cartridge route to

present auditive stimuli. The tones of the sound chip are used as the 'go' signal for the subject and can serve as trigger for other computers (like the PDP) to start some recording.
The system has been used succesfully to create long audio tapes with a fairly complex sequence of sounds and beeps. For questions mail to Lambert Schomaker (SCHOMAKE@HNYKUN53).

- Teaching speech to deaf children.

In this project an Atari ST was used as a visual display to interact with the teacher/pupil. A pull-down menu controlled the mode of operation and selected the graphic display. Visual dimensions like form, size, color, texture, movement and location were used to visualize all aspects relevant for speech training. Programming was done in GFA-Basic, which proves itself as a fast development tool. Nico Arends (POVEL@HNYKUN52) knows all about this.

- Computerized psychological testing.

The General Aptitude Test Battery (GATB) has been implemented on the ST in Pascal. The first seven tests can be used with full GEM and mouse support. The visual displays are coded in a very economical way. Frans Maarse (MAARSE@HNYKUN53) is responsible for technical support and can answer questions on this subject.

A computerized version of Kelly's Repgrid Personality Test (CAGE) has been developed in Gfa Basic and Turbo Pascal (IBM PC). The test works with GEM and is mouse driven. A principal component analysis and varimax rotation is done on the matrix scores. Results are presented by a graph. Frits van Heekesen (U212997@HNYKUN11) can give more information.

Other applications are an ST in combination with a digital scope program (Digitalis 4+, Computertechnik Zaporowski) which is used to monitor the input level of EMG and speech signals and some drawing programs in C used to record the time handicapped children need to draw segments. Frits also wrote a program which can present auditive and visual stimuli on the ST.

The ST has one problem in serving psychological experiments: the beast has no slots. On the other hand, its great graphics, compact size, large working memory and low price are attractive compared to the average IBM PC (-clone).

We would like to get in contact with other experimental psychologists that use ST's on their work. Maybe we can exchange some dedicated software. Or is the use of the ST in this respect confined to The Netherlands ?

(I hope I didn't bore all you non-psychologists to death with this)

> and stuff like that. Did any of this stuff ever get released?

The Mega (2 and 4 Meg) were released, but no upgrade for 520's or 1040's,
at least not from Atari. The blitter and upgraded OS was released,
but I don't know what the volumes are like. I haven't heard whether you can
get them for just any system. Atari is beta testing another OS upgrade. So
you haven't missed much from Atari. (That's not a flame, just my opinion.)

> Also, which are the latest mags for the ST computes. I sent

The magazines that I know of are: STart (8 times a year), Atari Explorer
(6 times), Reset (6 times), ST-Log (monthly). There are also newspaper
types like ST World. Apparently Compute's ST will not be publiched any more
(too bad). Current Notes (by the Washington Area Atari groups) is good.
Personally, I like STart, Explorer, and Reset. I wasn't impressed with the last
issue of ST-Log. Analog and Antic have some ST stuff, but they are mainly
8 bit magazines.

What you really missed is some great software. If you're into games, get
DungeonMaster. If not, look around. Anyway, welcome back to the ST world.

In article <1623@water.waterloo.edu> ljdickey@water.waterloo.edu I wrote:
>I have had trouble de-ARCing VKILLER. Before bulletin boards post it,
>they should check to see that they can de-ARC what they have.

Steven Grimm sent me a clean copy (Thanks Steven).

I found the one character that was corrupted and report, in
case you also had the same problem.

The posted version "vkiller.uaa" (as I received it) had this line:
MD 32D@J4@"PC00\,P (\),!8 848 '<8 '< =< /L3P 4 "Y8@%2P BMd

I seems that it should have been:
MD 32D@J4@"PC00\,P (\),!8 848 '<8 '< =< /D3P 4 "Y8@%2P BMd

If you have trouble de-ARCing VKILLER, check the UUencoded source,
and see if it has the string "L3P" in it. If so, try replacing that
one letter "L" with a "D" and try again.

Source record: 252006

One item I found to be its "fatal Flaw" was its printer driver(s). I don't own an Epson, or any other parallel printer other than an HP LaserJetII. My ST refuses to talk to the HP through anything other than the RS-232 port. Timeworks DTP-ST evidently _assumes_ you are using the parallel port for your printer. Using the Control Panel to reconfigure the printer port as the modem port didn't help, so I'm assuming that the driver code writes directly to the port circumventing the OS.

Nice program. Functionally equivalent to Ventura and GEM DTP for the IBMs. Useless to me, however, unless someone has any ideas...

I'm planning on buying a Mega 2 ST. I'll be using this in my business
and for personal use. Other than general business applications I what
to be able to do my own flyers and manuals for my business, and I plan
to use the HP DeskJet. But I have some questions.

1- Are they (mega 2's) around to be bought (I haven't tryed yet)

2- Are they only sold directly through dealer. (ie can I buy one mail order,
and if its possible does any one have any suggestions on a mail order
place.?)

3- How long before the new roms? Just curious, I really cannot wait.

4- I'm going to buy the Atari hard disc (the one that fits nicely under
the machine). Does anyone have any eperience with this? or warning
against it?

5- Does anyone have any experience (or recommendations for something better)
with these software packages?:

WordUp- looks good but haven't seen a review
Logistix- spreadsheet (I think that was the name) was reviewed in
STart recently
which paint program? Degas Elite or Spectrum or ?. the extra colors in
Spectrum are of no value to me (other than gee whiz) unless I
can get shades on my printer.
If wordUp isn't capable enough I'll buy Publishing Partner too.
I'm pretty familiar with its capabilties and I know
they're about to ship a new release.
I'm pretty set on Zoomracks, I hate traditional (dbase style) databases.

4209. Reliable 9600 bps... ?

Newsgroup: comp.sys.atari.st
Date: 1988-06-10 22:19:02 UTC
From: FXDDR@ALASKA.BITNET
Message-ID: <8806102122.AA29323@ucbvax.Berkeley.EDU>
Source record: 252009

I'm doing some data logging with the ST, collecting binary data from a 9600 bps serial source and storing it. The data comes in short bursts (a few K) with long pauses between them.

The program I wrote sets the iorec to 30K, much larger than I'll need, and uses Bconin and Bconstat to read in the data. It works fine for short bursts, but when the bursts are longer (1-2K or more) a few bytes are lost from each burst. After checking around it appears that the missing bytes are being missed by the interrupt routine and are never making it to the iorec. The program is very simple...no exotic interrupts or timers, just capturing a burst and writing it to disk.

So it would appear that the RS-232 handler is a bit too slow to run at 9600 bps continuously. However, when I use UniTerm in DCM mode, no bytes are lost from the burst. Apparently Simon is dealing with the problem. It looks easy enough...a very short assembler routine installed by a call to mfpint. What I haven't found yet is the "correct" way to find and save the pointer to the original RS-232 handler so that it can be restored afterwards. I'd hoped that mfpint might return the original but that doesn't seem to happen.

Any solutions or suggestions would be appreciated.

Thanks,
Don Rice

>I have actually purchased are STart and ST Applications. This is due to
>a frugal nature and a low budget. ...

These are the two I tend to read as well. I like both magazines, though I think they serve different purposes. ST Applications is oriented toward programmers and users, and provides useful advice/tips to both. START is centered around the disk that comes with each issue. ST Applications tends to review things more or less impartially, whereas START has a definite bias toward giving a favorable review (in my opinion) -- also the new section in ST Applications called ST Business seems to be a little more pro-Atari than pro-reader (again, only my opinion). Both magazines provide lots of useful information for Atari ST owners.

4211. MWC & large arrays -- help!

Newsgroup: comp.sys.atari.st
Date: 1988-06-11 05:10:55 UTC
From: paul@cacilj.UUCP
Message-ID: <734@cacilj.UUCP>
Source record: 252011

I'm having problems with the following construct:

```
struct x {
blah, blah ...
struct y arr[64][64];
};
```

where struct y is pretty small. I've checked the "sizeof" on a Sun-3 with the ints = shorts, and the sizeof(struct x) was 65500 or so -- just under 64k. However, MWC complains about the size being too big until I trim it down to ~16000 bytes! The exact error is from cc0, and reads: "size of struct too large". Using 3.0, I also got a message about size_t.

This is just the definition -- the actual storage is malloced. (Am I in trouble using malloc()? I know Malloc has bugs, but how is malloc()?)

Can some of you MWC gurus help me here? I am quite familiar with C, but this is my first big program on the ST. BTW, this isn't a program I wrote, I'm just experimenting with porting....

Thanks all!

There are a couple of different companies that make a board that you can plug into your motherboard that requires no drilling, cutting or hardwiring and allow you to expand your computer up to 4Meg. The bare board with connector and sockets are about $130 US. A fully populated 4Meg board is in the order of $1300 US. I don't know what they would cost in England. Ads for these boards are in all the ST magazines here in the US. Pick up a copy of what is available in England and look through the ads.

4214. New products

Newsgroup: comp.sys.atari.st
Date: 1988-06-12 12:31:06 UTC
From: t68@nikhefh.hep.nl
Message-ID: <472@nikhefh.hep.nl>
Source record: 252014

With all the anticipation about forthcoming products that get delayed
all the time, it was a surprise for me to see some new ST products that
I hadn't heard about.
Yesterday I visited my Atari dealer and he had just received:
1: A 68881 coprocessor board by Atari for the Mega (it has to be put
in the internal expansion slot). The price was quoted as Dfl 480,--
(divide by 1.9 to get the number in dollars).
There was absolutely no documentation with it (apart from the docs
for installation), but somebody told me that there has been some
agreement that Atari follows the same memory mapping as the
coprocessor sold by Weide electronics (for the 520 and 1040).
This was however a rather vague story which should be verified.
2: A 5 1/4 inch floppy station to be used with the ST series for a
price that is also way below what is currently asked by third
party vendors (quoted price was Dfl 350,--, but they had to check up
on that). I was told that there is a program by which one can select
whether to make MS-DOS compatible formats or just a TOS format.
This leaves me with a question:
Why is there so much noise by Atari about all kinds of hardware that they
cannot deliver for quite some time in the future, while at the same time
some useful products come out quietly via the backdoor?
Should I take a course on marketing to understand this?
Anybody from Atari c(d)ares to comment?

Jos Vermaseren

4217. Timer interrupts

Newsgroup: comp.sys.atari.st
Date: 1988-06-13 03:55:25 UTC
From: jpexg@mit-hermes.ai.mit.edu.AI.MIT.EDU
Message-ID: <3012@mit-hermes.ai.mit.edu.AI.MIT.EDU>
Source record: 252017

I've got a program where I want to get interrupts at a fairly high frequency, up to 1 KHz (the interrupt won't do much, so there should be time for it). Megamax, bless them, included an example of how to do this in the Laser C instruction book, and I copied and ran it. It interrupts at 48Hz, and works perfectly. Unfortunately, that's the ONLY frequency it runs at. The timer chip has various pre-divider rates (anywhere up to divide-by-200), but any division less then 200 (the largest, therefore the slowest) causes a crash. Then you can specify a starting point for the count-to-256 counter that actually generates the interrupt, but if that's set to anything > 0 (0 means count the full 256) again a crash. Is my problem with Megamax's specific code (which seems straightforward enough) or is it that the ST simply can't generate faster interrupts? Help would be much appreciated.

4218. Re: Omnires

Newsgroup: comp.sys.atari.st
Date: 1988-06-13 06:30:46 UTC

In article <6569@sigi.Colorado.EDU> cochrane@spot.Colorado.EDU (COCHRANE JIM T) writes:
>Is anyone on the net familiar with Omnires?

I have tried this but don't own it so I'm not an expert. It actually seems to work. It translates the colour screen into the mono format in software occasionally - so the mouse movement is jerky. You can alter the update rate if you don't mind spending a lot of cycles on a smooth mouse. There are several modes with different fill patterns for different colours and for the various combinations of resolutions.

From: leo@philmds.UUCP
Message-ID: <505@philmds.UUCP>
Source record: 252020

In article <46700006@hcx1> devon@hcx1.SSD.HARRIS.COM writes:
argc will always be at least 1. This is because the first parameter
passed (*argv[0]) will always be the name of the program. If an actual
parameter is passed from the shell argc will be 2 and the parameter will
be found in *argv[1]. A call with no parameters generates:
% ls
argc=1
*argv[0]="ls"
whereas a call with multiple parameters generates:
% ls file1 file2
argc=3
*argv[0]="ls"
*argv[1]="file1"
*argv[2]="file2"
It should be noted that this is not a bug in the libraries but conforms
exactly to the UNIX/C standards and is well documented in the K&R bible.

Everywhere you write '*argv' this should be: 'argv'. Note that argv is declared
char *argv[]; this means argv points to an array of pointers to char.
E.g. argv[1] is such a pointer, *argv[1] is the first character of the string
argv[1] points to. Note also that for the ST the name of the program is NOT
passed; this is because what the program really gets is an arguments line, that
it has to scan itself. The startup code that is linked with your modules should
take care of that; there is generally no way for it to determine the name it
was called with (some startup code make it a null pointer but I don't think
this is correct: in Un*x the first null pointer determines the end of the list)
. In Un*x the arguments and environment string arrays are already there when
the program starts.

>
> Aha! I saw that picture shortly after I got my ST, but didn't know who
> it was. Good sleuthing! (Is this Dr. Dobbs' brother?)

Actually, STart mag had a reference to this Bob guy (as well as the church of the subhuman gardening utensils or whatever) in one of their early issues. On the 'tidbits' page (or whatever it's called).

Speaking of the character set, can someone at Atari tell us why the hebraic (sp?) characters where chosen (in the upper half of the charset)? I can't believe that the number of people who actually use these characters approaches anywhere NEAR even 1% of the total number of ST owners (counter examples, anyone?). Why not use the same graphics characters as the IBM? Sometimes it's useful to be able to include nice charts & such in a text file, using these characters. In fact, forget about 'sometimes' -- it's quite FREQUENTLY useful to do so.

Sigh

4224. Re: Ramdisks and Increased Ram

Newsgroup: comp.sys.atari.st
Date: 1988-06-13 15:23:11 UTC
From: stone@amc-vlsi.UUCP
Message-ID: <514@amc-vlsi.UUCP>
Source record: 252024

Hi,

Ron mentioned that the external Ram Disk was used with Supra
Hard Disk driver. In fact any hard disk driver works. I'm supplying
(and I'll also release to the public domain) a driver and utilities
for the ram disk for the people that don't have hard disks.

This leads me another point. Found an interesting "bug" when playing
with the DMA code that Supra released to the public domain. When
entering and exiting Supervisor mode, the system call looks to see what
mode your in and toggles you to the other mode. So be careful, if you
call the DMA routines when already in Super mode you'll be toggled out
of super mode and nothing works. That is, the call to "Supon" turns Sup. off
if Sup. is on.

Glen

4225. Re: MagicSac please!!!

Newsgroup: comp.sys.atari.st
Date: 1988-06-13 15:25:16 UTC
From: dlm@druhi.ATT.COM
Message-ID: <3140@druhi.ATT.COM>
Source record: 252025

in article <8806082346.AA25453@ucbvax.Berkeley.EDU>, HAHN_K@DMRHRZ11.BITNET says:
> Could someone give me some information about the status of MagicSac???
> We would like to buy some of them and need to know a few things in advance:
> - what about MEGA-STs ?
> - what about HardDisks ?
> - what about printer-drivers ?
> - What about compatibility with MACs (disks and the like...) ?

Magic Sac versions 4.52 and later (current version is 5.91,
version 6.0 is being worked on) will work on Mega STs and with hard disks.
The hard disk code supports multiple hard disks and allows up to 8 Magic
Sac partitions. MFS hard disk partitions can be as large as 5 Meg, HFS
partitions can be as large as 16 Meg. The suggested retail price of
the "Magic Sac" is US $149.95.

The only printer drivers are for Epson compatible printers and
the Apple Imagewriter. The suggested retail on the Epson printer driver
is US $45.00.

If you purchase a "Translator One" you can read/write/format
Macintosh single and double sided disks using a standard ST disk drive.
It works with either internal or external drives. The suggested retail
on the "Translator One" is US $279.95.

Data Pacific does not currently sell in Europe and I don't
believe they have any plans to start selling there. So you would have
to rely on the US dealer to supply any support (ie. software upgrades,
etc.) instead of getting it directly from Data Pacific. You might have
some problems with repairs (if any are needed) since I don't know if
Data Pacific would pick up any of the shipping charges outside of the US
and Canada.

Two questions about ST hardware:

1) Does anyone know something about the SH204 HOST ADAPTER CARD bug ?
(HAC always returned SCSI success status even if the SCSI
controller (ADAPTEC 4000) signals an error)

2) Does anyone know, how far the DMA chip can address in memory ?
e.g. forcing a FWRITE(...) from address $FC0000 (the ROM location)
with more than 511 bytes produces garbage contents in the written
file,
same done with address $FC0000-1 correct contents.
(assumed, the system copies first the ROM data into RAM space
(because odd address) and then to the disk as the AHDI driver
do it)

>in storage

K&R say, that global static storage is zeroed before the main program is
executed. This null fill has to be done by the OS or the startup module.

Because the null fill is done by GEMDOS, no startup module touches the
uninitialized static storage. If the null fill is eliminated,
most C programs will bomb.

4230. Midiws

Newsgroup: comp.sys.atari.st
Date: 1988-06-13 18:57:18 UTC
From: kurth@sco.COM
Message-ID: <257@scolex>
Source record: 252030

I have never called midiws with more than about 7 or 8
back-to-back notes without some delay in between calls. I have
successfully called Midiws with a length parameter of about 4096
TOS is also fast enough to receive long messages at full midi speed.
In other words you can receive mesages larger than the internal midi
buffer. I use Bconstat and Bconin in a tight loop. I find that
this receive loop takes up about 80% of the CPU (I have time for
some minimal processing inside the loop).

4231. Re: Satellite hook-up anybody?

Newsgroup: comp.sys.atari.st
Date: 1988-06-13 20:38:31 UTC
From: magore@watdcsu.waterloo.edu
Message-ID: <4795@watdcsu.waterloo.edu>
Source record: 252031

By the way, for those who are interested I will be posting a NEW
version of my satellite decoder software and hardware to the net sometime
during the next few weeks [I now have an addition that allows use of a
stereo tape deck so that signals need not be digitized "real time".
The new circuit works for both NOAA and METEOR satellites.

Hello Ron,

In article <2550@ihuxy.ATT.COM> rnss@ihuxy.UUCP (Ron Schreiner) writes:

>About 1.5 years ago Antic published a project that would convert
>satellite pictures that are rebroadcasted on a VHF channel into
>images for your 8bit, they also showed how to connect it to
>a ST
>
>The circuit was simple, just one IC, with most of the work being done
>in software.

Yes, in fact I saw that issue. I have a few comments to add here for
those who haven't seen the article you refer to. For background, many
satellites photes [and weather maps] are rebroadcast on various shortwave
bands using a format called WEFAX - Weather FAX, FSK 120/240 lines per minute.
The Antic article used ONLY a 1 bit decoder - either on or off output -
whereas a WEFAX FSK signal can have gray scale info in it - ex shades of gray
as well. The Antic decoder connected to the shortwave radio audio
output jack and converted the variable frequency audio tone of the WEFAX
format into a 1 bit on/off output that the computer used in forming an image.
Needless to say with only one bit of output the Antic circuit generated
almost useless images of satellite photes [since they have gray scale
to start with] - Weather maps on the other hand work rather well
because they are only black or white - ex without any gray scale - so no
detail is lost. One might consider using an analog to digital converter
after the FSK decoder they used to get improved results. Another method
that might be considered, with some deal of effort, would be to make
an FSK decoder in _software_ and then replace the Antic circuit with
a filter and a zero crossing detector.

Things to consider for anyone thinking of WEFAX is
the quality of signal you might receive. Shortwave signals
are subject to a whole host of natural and man made forms of
interference. Also signal propagation is generally controlled by
ionospheric reflection - "skip" - this is a function of transmission
frequency - which can , and generally does, wreak havoc with signal quality.

For direct reception from the satellite you can buy the receiver
and the parts to decode the signals directly from the satellite for about

$100 to $150CDN. The signals are "line of sight" and the are VHF FM signals
[137.5, 137.62 MHZ for NOAA 9 and NOAA 10]. The bottom line here is that
the signal quality is orders of magnitude better then anything you may likely
get rebroadcast from a WEFAX station - unless of course you live next door to
one!. At this time I only convert the images into 8 bit grey scale
which can then be converted into other formats such as AIM or DAGAS format.
Since 8 bits is greater then the 4 bit limitation of the ST display
one has to play games with grey scale compression to make the best
use out of the ST - however having the extra detail to start with
is VERY nice!.

Of course as Ron says the Antic circuit is EASY to build
and it's a good point that I don't want to leave unnoticed. The Antic
circuit is also low cost to put together - IF you already happen to
have a good shortwave receiver - otherwise it's about the same cost
as the more complex circuit I have built.

Best Regards,

PS - for all those who have sent me mail I am sorry I have not yet replied
to many of you - hopefully my follow up postings will help out those who did
not get the originals - there are also some minor "bug" reports that
have been received, documentation has been fixed and other improvements...

In article <360@piring.cwi.nl> steven@cwi.nl (or try mcvax!steven.uucp) writes:
->In article <1904@alliant.Alliant.COM> I wrote:
->> i guess i'll stick with good 'ol alcyon (maybe slow but it works...)
->
->Ha! After months of fighting the buggy code produced by Alcyon, I
->threw the damned thing away and went over to MWC. I only wished I'd
->done it earlier, and saved all that trouble.
->

well, what can i say...MWC was not around until about a year into my investment
of time,time,time. and when it did come out, it was probably worse (v1.x) and
lacked a lot of the things i needed anyway.

v2.x of MWC was better, but still not worth me throwing out (or trying to
convert) 30-40,000 lines of my own alcyon code as well as maybe another 60,000
lines of PD stuff that DOES work. i more or less like my current environment
which centers on alcyon.

your argument failed to include what could be your strongest argument: MWC
is evolving, alcyon is dead (though if ST sales wane, i doubt MWC will see
any more enhancements either :^).

i don't know what kind of stuff you write but at this point, i can easily
debug alcyon and have only found very few (and far between) actual bugs in the
compiler. it does have its limitations, mainly in the user interface area
(can't redir output, cp68 -I does not work like a unix compiler cpp would,
won't accept "/" in include files - does MWC do this? - etc). considering it
has been around for so long in basically it's original form, it is still a
good compiler. i wrote my own cc front end and have very few problems. the
library is very unix-like and those routines which did not work corectly i
replaced.

i often convert comp.sources.unix stuff to run under a gulam shell and find
that generally, the port requires ST-specific changes, not alcyon-specific
changes. i'm sure you can say the same for MWC.

there are a lot of us who still use alcyon, and like it. i will probably
buy MWC 3.x as well, once i get my personal libc makefile built :^). enjoy
your compiler but don't mislead everyone else.

adios...

-bill

From: jgj@hcx2.SSD.HARRIS.COM
Message-ID: <46700008@hcx2>
Source record: 252039

I have experienced this problem too. As far as I can tell, in 3.0, structures
are limited to 32Kb. Also, elements of an array are limited to 32Kb. Thus the
declaration
char array[10][33000];
causes wrong code to be generated for references to array. The problem is,
the compiler uses 16 bit quanitities to remember element sizes. The code
that gets generated for
cp=array[i];
is the base addresss of array plus i times the sign extended low order
16 bits of 33000! Very frustrating. I spent two hours of debugging before
I put the pieces of the puzzle together.

```
New release 1stw2ps Version 3.21 12 June 1988
=============================================

1stw2ps is a program that makes a postscript file from a 1stWord
or WordPlus file. The printout you will get looks much better than
that from any 24-pin, dot-matrix printer.

Spaces are adjusted so that each space occupies the same length on
a line.

New:V3.1 Several special characters are supported:
-- Output to RS-232 or Centronics.
-- Special header fontstyles.
-- Date and time inclusion.
-- Most (all?) bugs are fixed. I just forgot them
(e.g conditional pagebreaks bug).

New V3.11 -- copies option included.
-- head and footline bug fixed.
-- another conditional pagebreak bug fixed

New V3.21 -- RS-232 output bug fixed ?
-- Integrals, and powers 2 and 3 added.
-- a few other things.

Contents of (uue) archive :

%->Ha! After months of fighting the buggy code produced by Alcyon, I
%->threw the damned thing away and went over to MWC. I only wished I'd
%->done it earlier, and saved all that trouble.
%->
%
%well, what can i say...MWC was not around until about a year into my investment
%of time,time,time. and when it did come out, it was probably worse (v1.x) and
%lacked a lot of the things i needed anyway.
Glad I missed that. I jumped into things with 2.0.
%
%v2.x of MWC was better, but still not worth me throwing out (or trying to
%convert) 30-40,000 lines of my own alcyon code as well as maybe another 60,000
%lines of PD stuff that DOES work. i more or less like my current environment
%which centers on alcyon.
I dunno, looking at code written for alcyon reminded me too much of looking
at something written for a bad C compiler I remember from MSDOS days. Yeah,
that's it, it reminded me of Microsoft Fortran-77 and such. Manually invoked
compile & link phases, weird command line switches to the linker, etc.
Bleah.
%
%your argument failed to include what could be your strongest argument: MWC
%is evolving, alcyon is dead (though if ST sales wane, i doubt MWC will see
%any more enhancements either :^).
Well, here's hoping that things continue to improve. Now that I've got the
3.0 compiler, I'm thinking about porting Gnu's GCC anyway though, so mebbe
it won't matter...
%
%i don't know what kind of stuff you write but at this point, i can easily
%debug alcyon and have only found very few (and far between) actual bugs in the
%compiler. it does have its limitations, mainly in the user interface area
%(can't redir output, cp68 -I does not work like a unix compiler cpp would,
%won't accept "/" in include files - does MWC do this? - etc). considering it
%has been around for so long in basically it's original form, it is still a
%good compiler. i wrote my own cc front end and have very few problems. the
%library is very unix-like and those routines which did not work corectly i
%replaced.
Yeah, include files were always a pain. I seem to recall that the '/' didn't
get recognized. I always had to #ifdef 'em to something else...

%
%i often convert comp.sources.unix stuff to run under a gulam shell and find
%that generally, the port requires ST-specific changes, not alcyon-specific
%changes. i'm sure you can say the same for MWC.
I've got Gulam, but I'm already too used to MWC's msh to switch over. Mebbe
I'll wise up. (msh's attempt at a history mechanism is poor, at best.) I get
a lot of Unix code running on my ST as well. Ported Larn 12.0 using MWC 2.0.
(Has anyone ported compress yet? I started, since I just finished with ARC,
but haven't gotten it working yet.) On the whole, the Mark Williams libraries
have been pretty good at emulating Unix.
%
%there are a lot of us who still use alcyon, and like it. i will probably
%buy MWC 3.x as well, once i get my personal libc makefile built :^). enjoy
%your compiler but don't mislead everyone else.
Oh yeah - you can also get the source for Mark Williams' libraries for a fee.
I haven't yet, but plan to. Ah well. From the glimpse I got at alcyon via the
UUPC sources, (which I tried vainly to fit into the MWC scheme of things on
my system for a couple days...), I'm pretty sure I wouldn't like the system,
and I *do* like MWC. I s'pose ya have to say "to each his own," but it'd be
nice if there was a standard. It'd make the sources newsgroup a little more
useful, f'r'instance....

4242. Mono shakes/Uniterm blues

Newsgroup: comp.sys.atari.st
Date: 1988-06-15 03:05:00 UTC
From: SKF8192@TAMSIGMA.BITNET
Message-ID: <8806150400.AA20432@ucbvax.Berkeley.EDU>
Source record: 252042

I have a SM124 Monochrome monitor. I just recently moved and now the screen endlessly shakes and quivers. Is there some adjustment I can make to correct the problem?

I am using UniTerm V2.0c and love it. I do have one question though. When I have the RS232 settings at 2400bps 7bits 1 stop Even I do not get the OK response back from the modem or the CONNECT 2400 message. When I am using Kermit 0.9(40) on my Magic Sac with the same settings I do get the response. Is this a problem with Uniterm or with my modem?

Thanks for the Help.

4243. Is GDOS compatible with GDOS

Newsgroup: comp.sys.atari.st
Date: 1988-06-15 06:23:10 UTC
From: davel@hpvcla.HP.COM
Message-ID: <4730021@hpvcla.HP.COM>
Source record: 252043

I have two programs, Athena (a CAD program) and Degas, that use GDOS. The problems is I can't make both programs work with the same assign.sys file. One problem is the path variable. Degas wants to use GDOS to load fonts and seems to want those fonts in a folder names, of all things, fonts. So, path = c:\fonts\ or path = c:\gdos\fonts will make Degas happy.

Athena, on the other hand, wants to use GDOS for it's printer driver. If I put the printer driver, fx80.sys, in the same folder as the Degas fonts and use the Degas path definition, Athena can't find the driver and bombs (literally). An assign.sys with path = c:\gdos\ (fx80.sys of course is in c:\gdos) and all the Degas font defintions stripped out works fine.

If all this sounds confusing it accurately represents my state of mind. Does a description of GDOS and it's assign.sys file that's accurate exist?

I would appreciate any leads.
Thanks,
Dave Lowe

I'm not trying to mislead anyone. Quite the contrary in fact. You claimed that Alcyon worked, and I pointed out the the reason that I stopped using it was because it *didn't* work. I don't have Alcyon online anymore, so I can't go and try and recreate the problems it produced, but I do remember, as an example, that it was completely unable to cope with an initialised array declaration with nested {}'s that I had.

But still, I don't want to stop you from using it. I just wanted to point out that for the programs I was compiling, it was essentially useless.

Dear readers,
I have a problem which some of you probably have encountered before,
that is reading a character from screen at current cursor position.
Somehow I have not been able to find the proper gemdos (?) function
call for this. Does anyone knows how to handle this, preferably in
Fortran or Pascal??

In article <5042@sdcsvax.UCSD.EDU> hutch@net1.ucsd.edu (Jim Hutchison) writes:
[spelling edited :-)]
>By the way, is there a fix for the parallelogram keyboard problem?
>I mean the one where I type nice too fast, and pick up the comma to go with
>the "ice". I am not sure what this is.

Whether and how this happens depends on the keyboard arrangement.
Many keyboard scanners make a matrix from the keyboard:

```
d0 d1 d2 d3 d4 d5 d6 d7
| | | | | | | |
a0---[ ]---[ ]---[ ]---[ ]---[ ]---[ ]---[ ]---[ ]---
| | | | | | | |
a1---[ ]---[ ]---[ ]---[ ]---[ ]---[ ]---[ ]---[ ]---
| | | | | | | |
a2---[@]---[A]---[B]---[C]---[D]---[E]---[F]---[G]---
| | | | | | | |
a3---[H]---[I]---[J]---[K]---[L]---[M]---[N]---[O]---
| | | | | | | |
a4---[P]---[Q]---[R]---[S]---[T]---[U]---[V]---[W]---
| | | | | | | |
a5---[X]---[Y]---[Z]---[ ]---[ ]---[ ]---[ ]---[ ]---
| | | | | | | |
a6---[ ]---[ ]---[ ]---[ ]---[ ]---[ ]---[ ]---[ ]---
| | | | | | | |
a7---[ ]---[ ]---[ ]---[ ]---[ ]---[ ]---[ ]---[ ]---
| | | | | | | |
```

(The exact placement of the keys varies.) This conveniently produces
64 keys (enough for 56 key keyboards) arranged on an eight(-data)-bit
by eight(-address)-bit grid. If each keyswitch simply shorts the
address line to the data line, the keyboard can be scanned with a loop
like the following:

```
#define KEYBOARD ((char *)0x3800) /* on a TRS-80, eg */
for (r = 0; r < 8; r++)
for (c = 0; c < 8; c++)
if (KEYBOARD[1 << r] & (1 << c))
/* the key at (r,c) is down */;
```

(Of course, the scan loop must account for keys that are held down for
some time, and possibly do debouncing, and all sorts of other grungy
work. But none of that matters in regard to the `parallelogram
problem'.)

Now, given the keyboard arrangement shown above, if push down A, I, and M to type `aim', I have shorted the following pairs: (a2,d1) [A] (a3,d1) [I] (a3,d5) [M]. By so doing I have effectively also shorted (a2,d5): current can flow from a2 via d1 to a3 ([A] then [I]), then from a3 to d5 ([M]). Even though I only put current directly on a2, it `leaks' to a3 and from there it gets to d5, so my scanner sees [E] down and I wind up typing `aiem'.

There are two ways to fix it. As usual, it can be done in either software or hardware. The software solution is uglier: scan the whole keyboard before deciding that any given key is down. If keys are down in a parallelogram (as defined by the actual arrangement, which is often not alphabetical), wait for enough of those keys to be released to be sure as to which ones are really down. (An easy variation is to wait whenever more than two keys are down.) The hardware solution is more expensive: add diodes at the keyswitches, so that current cannot flow across the parallelogram.

What is the status this week of the Abaq and '030-based
system? They've been changing that frequently for the
last two years of their development. I've heard that
memory costs, European demand, factory loss in Taiwan,
Helios development, etc, etc, are delaying. Anyone
heard anything else? Why did Atari's new VP of Computer
Marketing leave (resigned/fired/nothing to do)? Any word
on the Transputer machine from Commodore -- comparison
to Abaq? June's Byte has an article on the Abaq and Helios.
Helios isn't written in occam. Seems Mach from CMU would
have been a good choice, but they (Atari) don't seem to be
aware of its existance.
Is Atrai (Corporation) on the network (this list)? Do they
participate (Neil Harris, et al -- or their new PR firm that
replaces his former function)? They have their own bbs
inhouse. I used it for a while in the past, but seemed a waste.
Does anyone know if it's improved in the last year?
Hope this message hasn't seemed too negative in tone. I really
am enthusiastic about the Abaq -- if it's produced -- shades
of 120 ST/C64 portable/and many others.

I Just ordered the update (3.0) of Steinberg's Pro-24. According to the notice I got, it adds many new features to 2.1 including more intuitive editing (click and drag), drum editing, and a completely new manual (Let's hope it's better than the previous ones).
3.0 should be available to everyone in about a month.
They have just started shipping updates to previous customers. (I got my notice yesterday).

I found that Dr. T's did not have some features that I need.
I'm a classical guitarist, not a keyboard player, so
I need to be able to enter some data in standard music notation.
The Pro-24 let's you do this, although it's not a real scoring program.

In general I'm quite pleased with the Pro-24. (I second Craig's opinion on the lousy manuals, though.)

There are a couple of different companies that make a board that you can plug
into your motherboard that requires no drilling, cutting or hardwiring and
allow you to expand your computer up to 4Meg. The bare board with connector
and sockets are about $130 US. A fully populated 4Meg board is in the order
of $1300 US. I don't know what they would cost in England. Ads for these

boards are in all the ST magazines here in the US. Pick up a copy of what
is available in England and look through the ads.

4250. Midi problem revisted

Newsgroup: comp.sys.atari.st
Date: 1988-06-15 19:27:00 UTC
From: UUCJEFF@ECNCDC.BITNET
Message-ID: <8806151931.AA05945@ucbvax.Berkeley.EDU>
Source record: 252050

A few weeks ago a reader had a problem with outputing several midi bytes.
I think he was trying to use the Xbtimer. I have later found out courtesy
of Stefan Daystrom of Hybrid Arts that you cannot have any TOS, BIOS, or
XBIOS calls inside an interrupt. You have to do whatever it is you want without
the calls, this is due to the re-entrancy characteristics of the ST.
Therefore, you cannot use Bconstat or Midiws from inside and Xbtimer interrupt.

I was having the same problem, I was thinking it might have been the stack
size, but replaced it with the same code that the system call would have done,
(modifying it to fit the routine) and it works perfectly. I even save
time by avoiding all the stack bookkeeping by the subroutine call.
I got the code of those system calls from Abacus, you can also get them
from the developer's kit.

While this fact problem was explained somewhere in the docs, it would
have been nice if they would have mentioned this in the docs of the
Xbtimer call.

In a recent posting, Keith Hedger flamed Atari's policy of marketing Megas, with particular reference to the Midi world. I will refrain from posting my personal opinion of the use of expletives etc in public posting.

The following is the response from Larry Samuels, Atari's corporate VP of Strategic Markets, who has a special interest in the music market. I quote it verbatim:

Answer from the "guys at Atari"...
In answer to the recent "FLAME" on USENET regarding Atari's Mega system sales requirements for music dealers: the Mega 2 and Mega 4 computers CAN be purchased by music retailers separately from laser printers. The Mega system sales program described in the message from Keith Hedger pertains to computer specialty dealers only. One would think that Mr. Hedger would collect his facts carefully before launching such a vitriolic attack in error. Atari's commitment to music is strong and constant, and we are very aware of the increasing need for larger RAM in various music/computer applications.
Mr. Hedger also refers to a $2900.00+ price point for a Mega 2 system. This statement is greatly in error. The list price of the Mega 2 monochrome system is $1699.95. Atari appreciates the fervor indicated by Mr. Hedger, and his obvious concern for our strategic direction and distribution policy. We are concerned, however, that such misinformation would be placed in a public forum and accordingly we request that in advance of such statements in the future, Atari be called and the facts of such perceived policies be confirmed.

"Atari and Music...Catch the Wave"
Larry Samuels
V.P. Strategic Markets, Atari Corporation (U.S.)

Hello,
In Info-atari16 Digest 06/15/88, Bruce Heimbigner writes:
>I'm planning on buying a Mega 2 ST. I'll be using this in my business
>and for personal use. Other than general business applications I what
>to be able to do my own flyers and manuals for my business, and I plan
>to use the HP DeskJet. But I have some questions.
>
>1- Are they (mega 2's) around to be bought (I haven't tryed yet)

Well, you saw what Atari wants dealers to do in order to sell Mega.
Good luck. I really hope they know what they are doing, it seems sheer
suicide.
>2- Are they only sold directly through dealer. (ie can I buy one mail order,
> and if its possible does any one have any suggestions on a mail order
> place.?)
See above.
>3- How long before the new roms? Just curious, I really cannot wait.

The new ROMs will be available after the current phase of beta
testing, which started at the beginning of this month according to
various messages (which were posted here too). But "soon" can mean
anything with Atari. Sheesh...
>- I'm going to buy the Atari hard disc (the one that fits nicely under
> the machine). Does anyone have any eperience with this? or warning
> against it?

I use my SH205 since October 1987 and it is half-full now (or still
half-empty :-)). Never had a problem. Get a back-up program
(BACKUP! by Michtron is nice, but I was told that Turtle (PD)
is much better) and a goot hard-disk boot (allowing you to
boot accessory and Auto folder from C:).
Beware,most of the RAM disk programs create a C: Ram Disk which is
incompatible with a hard-disk. See if yours are well-behaved.
>5- Does anyone have any experience (or recommendations for something
>better) with these software packages?:
>
> WordUp- looks good but haven't seen a review

> I'm pretty familiar with its capabilties and I know
> they're about to ship a new release.

> I'm pretty set on Zoomracks, I hate traditional (dbase style) databases.
If you use an HP DeskJet, buy Migraph EasyDraw 2.3 with EasyTools.
You can produce some very nice newsletters and flyers with little time
and effort. I am very satisfied of Migraph customer support. They
even helped me when I had a problem with UPS for delivering these
packages! You can purchase the DeskJet driver from them, along with
screen copy programs (mono and color). I highly recommand EasyDraw 2
with the DeskJet.

I am considering purchasing a Supra 20 meg hard drive for the ST. I would appreciate hearing of peoples' expriences with and/or knowledge of the quality of the drive. I am, of course, mainly interested in reliability. If you don't wish to clog up the net, you can email me. If I receive informative replies by mail I'll summarize and post them to the net.

Thanks,

Jim Cochrane

4256. Mark Johnson C

Newsgroup: comp.sys.atari.st

Has anyone out there had any experience/luck with Mark Johnson C. I am trying to compile a C program which I wrote under BSD 4.3 on our VAX at at work at home on my 1040. The program is fairly simple and straight forward. It simply reads a SLAM II input file, parses the file line by line for a renumbering purpose and writes out a modified file. The program works fine on our vax but when I try to compile using Mark Johnson C v2.0 I get a 0 byte output file. I have had very little success using this C package so far ('hello, world' really works great) and I think I might have to break down and buy MWC or maybe Laser C.

Any suggestions would be appreciated.

> Fortran or Pascal??
>
> Wil Groenen

This can't be done easily. The screen image is stored as graphics data.
No data that describes which character was used to generate the graphics
information is maintained.

Therefore, to find out which character was used, assuming
that you know what resolution you were in and which font table was
used, you could extract the graphics information from the screen
and compare it with every entry in the font table until
you found a match.

It would probably be easier just to save a local image
of the screen as you create it. It *IS* possible to get the current cursor
location by sending the cursor save string to the roms and then
looking in the documented location for the saved cursor address.

At least that way you don't have to keep track of the cursor position
but you will probablyt have to keep track of the data.

Good luck,
- kurt

4258. mega woes

Newsgroup: comp.sys.atari.st
Date: 1988-06-16 22:26:00 UTC
From: PETCHER@FSU.BITNET
Message-ID: <[gw.scri.fsu.edu].854A7080.00914702.PETCHER>
Source record: 251958

I am not having very good luck with Mega 2's so far. Last December I purchased one, which was obviously buggy from day one. Typically after the machine was on for about an hour it would simply start crashing randomly with no apparent cause. Partly because I also had some new software and partly because I was busy with other things at the time, it took me about a month to realize that the problem was really a hardware problem and two or three more weeks to get to where I could sufficiently demonstrate it to my dealer in a controlled environment (i.e. I had to learn how to crash the desktop without any other programs present, lest they be accused of being the culprits). It appeared to be a heat problem in the end - some chip just couldn't take the heat.

Finally it was obvious that the machine should go back. So the dealer called Atari, they agreed, and that was that. After somewhat over two months of waiting I finally recieved a replacement. Aside from the long wait (I had a 1040ST available at the time so I didn't ask the dealer for a loan) that was all well and good. One occasionally expects a lemon with any sort of complicated equipment. The first strike against Atari though is that there are only two Mega owners in our local Atari users group and *both* of us had the same experience with the first machine we recieved. Both had hardware problems. And they were not purchased in the same store, but several hundred miles apart.

4259. Uniterm vs. Blitter question

Newsgroup: comp.sys.atari.st
Date: 1988-06-16 22:41:00 UTC
From: PETCHER@FSU.BITNET
Message-ID: <[gw.scri.fsu.edu].B5253180.00914704.PETCHER>
Source record: 251959

When I run Uniterm 2.0c on my mega 2 with the blitter on, the program hangs up or crashes. But if I turn off the blitter everything goes fine. I typically run Uniterm from the GPshell (a Unix shell) with only the control panel and the STart file selector as memory resident programs. I may have the GPshell's built in ram disk and disk cache program running as well from time to time.

Has anyone else experienced this? Is it possibly an incompatibility problem of Uniterm with the blitter, or is my blitter buggy. An alternative question is, what list of programs should the blitter work well with and which programs are incompatible. (i.e Can anyone offer a suggestion for a good 'blitter test'?) I would like to find out if the blitter is having problems as soon as possible because my warranty is nearly up.

Please e-mail me directly if possible, since we only receive the digest and it would take quite a bit of time before I'll see the responses otherwise.

Thanks,
Don Petcher

> V.P. Strategic Markets, Atari Corporation (U.S.)
> --

Mr. Hedger's posting states that he talked to two dealers who both had
the understanding he reported. That sounds like sufficient care in
collecting his facts. Unless, that is, you claim he is lying.

The constructive response to Mr. Hedger's posting would have been to
find out who the dealers he talked to were and who at Atari was giving
them the wrong info. Next you should have found out who else had been
given the same impression by this person (or persons, of course) and
contacted them with the correct information.

Atari has a considerable credibility problem in dealer relationships.
On the one hand, it apparently has some policy statements which are
circulated at the vice-presidential level and then it has the _real_
policies which are what the dealers hear from the company. There
appears to be enough inconsistency here to be causing some dealers
to consider abandoning the line.

If I were a _computer_ dealer being told that I have to sell an unwanted
~$2000 item to my customer in order to be allowed to sell him a $1699.95
device he wants while the _music_ dealer a block away doesn't have this
restriction I would be talking to my lawyer or C= Amiga by now.

I called Atari to determine a local dealer for the mega's, the closest
are a couple of hundred miles away. I'm used to that in Pullman, WA
but I expected Spokane (80 miles) would have them. instead Seattle area
was the closest (I hope that will change). Any how, I ordered a color
mega 2 (by phone i sure was'nt going to drive there). Acourding to the dealer
it has a blitter in it and that the new ones he's getting some do and
some don't have the blitter. Oh, by the way no-one tryed to sell me a
laser printer for it so i'm sure Atari isn't trying force the dealer to
buy one with every mega they buy. It's true you cannot get a mega mail
order. The dealers I talked (the ones that had megas) said the new
requirements weren't that much problem but the ones who were without
Megas did kinda bark about it.

I was able to do a little bargaining and I think got a fair price.
BUT, it was more than I thought I'ld be paying. It made the choice
between a Mac and ST more difficult but availble color, blitter, 2 meg,
compatilbity with MS-DOS discs (which they force me to use at work)
won out in the end. Another important factor was the cost of software
I plan to be legal and buy software that I use, this alone would have
made a Mac at LEAST $600 more expensive. (Yes, I know there is software
on the Mac that is more capable, but the gap is closeing ;)

Source record: 251965

At the CAD-CAM show here in Toronto, ATARI was demonstrating a CAD package on a 1024x1024 ish (1024x960?) monitor that was running GEM. The monitor was connected to a separate video board in the Mega. Supposedly it could also run in colour & was from Germany. A second board from France is also supposed to exist although the German board was said to be more compatable. No price, no delivery and no name. Has anyone else heard about these boards? Prices? Availability?

There were also 2 Abaq (Abaci?) running a demo at the show. Very pretty but very much prototype machines.

Neil,

You will probably find that rebooting after changing the name will work. The problem is that GEMDOS maintains a list in RAM of folders so that it can speed up access to them. Changing the name directly will therefore not update the RAM copy.

Hope this helps

Russell

Yes, I've had v2.0 for a week or 2, and I've compiled one program in excess of 1700 lines or so with no problem. I'd like to help you but your problem description is pretty vague (but not more so than some MR's I've received ;-)).

Remember: MJC (and MWC) have 16 bit ints and 32 bit pointers which cause 99% of all porting problems in my experience. Run LINT on your vax code and look for mismatched pointer assignments and inconsistent use of parameters to functions (Mark: any chance of supporting function prototypes ala ANSI?).

If that fails, take a shot at sprinkling some printfs in your code to insure your getting into main ok and so on. Look through your code to see if any kind of error will cause you to exit early.
As a last resort, compile your program one function at a time and test: compile main (commenting out function calls in it), then the next function etc.

Good Luck.

Message-ID: <5203@batcomputer.tn.cornell.edu>
Source record: 251974
Cross-posted to: comp.sys.mac,comp.sys.atari.st

Hi,
I have a Seagate 238 (30 meg, RLL) hard disk which I currently have hooked to my Atari ST via an Adaptec 4070 (I think that's the number) controller (which I think is a SCSI controller) and another board which translates the SCSI signals into something the Atari can understand. Anyway, I need to use a Macintosh SE for a senior thesis/project I'm working on and I don't think I can deal with a floppy-only system with a Mac any more. Macs beg for hard disks and I think the Mac can beg louder than the Atari for this year. So what I want to do is buy a two-drive SE and new cabling for the Adaptec controller so that I can use it with the SE instead of the Atari for now.
I need to know if this can be done, which I think it can, but I'm not a great hardware person. If so, I need to know what sort of cable to buy to interface the Mac with the Adaptec board. Then, what sort of software would I need to install this hard disk? Will Apple's Installer program work, even though this isn't a Apple hard disk? Is there anything else I have to be careful of when setting up a hard disk system like this? Any advice or other information is welcome and if I recieve enough responses I will summarize them to the net.
The reason I have this hardware lying around is that hard disks for the Atari are as expensive as ones for the Mac, so I bought all the pieces separately (controllers, case, power supply, hard drive) and put them together. I would like to convert most of this stuff to the Mac so I can have a really good 30 meg Mac without spending a fortune on another hard drive.

Thanks a lot!
Adam

> purchased by music retailers separately from laser printers. The Mega system
> sales program described in the message from Keith Hedger pertains to computer
> specialty dealers only.

Whoa! Wait a minute. I was going to respond to Mr. Hedger's posting myself,
in the form of a NASTY flame at Atari regarding the foolishness of "bundled"
laser printers. Then I stopped myself, saying "this cannot possibly be the
case -- surely Atari's marketing department cannot be this reckless."

Now it seems (from a *VERY* official source) that if I want a MEGA without
a laser printer, I'm going to have to buy it from a MUSIC store!!! I hope that
this is simply an error in wording on the part of Messrs. Samuels and Good.
The problem is certainly not in MY reading, so maybe its their writing :-)

At the moment, I'm still an impoverished student (income < 15000 p.a.) so
chances are, I'll have to wait awhile before getting a MEGA 4, and just suffer
with my 1040. (that or sell my car.)

However, when I do buy a new system, I will almost certainly *NOT* want to
by a laser printer to go with it, and will definitely not want to but an
ATARI laser printer. No offence, it just does not and cannot suit my needs.
Besides, I have access to laser printers in my office (and I won't likely take
a job anywhere that I won't have such access).

Besides this, laser printer technology is OLD and OBSOLETE (I'm told)
and overpriced as well. The new solid state technologies are claimed to be
both cheaper and more reliable (at least according to BYTE, as far as you
can believe that...). I feel that if Atari tries this bundling stunt, they
will very possibly be jeopardizing sales of a very worthy product (namely
the Mega ST's) simply for the sake of unloading a large stock (?) of printers
which would have sold just fine, if they had hit the market when promised.

> One would think that Mr. Hedger would collect his
> facts carefully before launching such a vitriolic attack in error.

I certainly hope (for Atari's sake) that the basis for MY posting is
also erroneous (in which case I will happily retract any unkind statements
I may have made). While *my* information is an official (i think) statement
of one of atari's vice-presidents, my main complaint is with a single
sentence which may have simply been stated incorrectly. Perhaps somebody
out there will clear this matter up by telling us what Atari's officials
policy regarding laser printers IS, rather than what it IS NOT.

> ... Atari appreciates the fervor indicated by Mr. Hedger, and his
> obvious concern for our strategic direction and distribution policy. We are
> concerned, however, that such misinformation would be placed in a public forum

You have ever right for concern, and in fact, probably deserve an appology.

> and accordingly we request that in advance of such statements in the future,
> Atari be called and the facts of such perceived policies be confirmed.
>

What's the number? Perhaps spreading it around will prevent future errors.

> cursor position.

I do not have detailed knowledge about this (my manuals aren't here at the moment), but I would theorise that this is not possible. Remember, once the character is drawn on the screen it is just a bunch of bits. This is quite unlike the usual video screens for IBM-type computers. It would take quite a program to read the pattern of bits and tell which character it was.

Well I know the problem exists with the version of SH204 that I bought (full price of $800!) two years ago. It's a bug in the PAL. I got a fix for it from Berkeley Micro Systems (415) 465-6956. The BMS fix consists of a replacement PAL which plugs in a socket on the SH204 host adapter board. I've been using the BMS PAL for several months with absolutely no problems.

Disclaimer: I am not tied to BMS, except that in the past I have sold their BMS-100 host adapters to some of my customers.

I have to say that I don't go for those kinds of words in a USENET posting,
but I sure can identify with the frustration that was behind that
posting. And to have someone at Atari complaining about this is a little
odd (don't you have more important work to do, Mr. Good?. It seems that the
only way lately to get you, or anyone else at Atari, to comment, is to
use these words...)

Why should they be "punished" (e.g. forced to purchase an over-priced, under-
featured laser printer and then try to foist it onto an unsuspecting customer)?
If the laser printer is such a dog (as it seems to be), why don't you "guys
at Atari" just shut up and eat them quietly?

There's something called an EtherportSC, (from 3com, I think) intended for a Mac really, but it's an ethernet adapter that attaches to a SCSI port. Might be usable, provided you could get enough docs to write a driver for it on the ST...

4281. ARC sources, revisited...

Newsgroup: comp.sys.atari.st
Date: 1988-06-18 08:49:08 UTC
From: hyc@math.lsa.umich.edu
Message-ID: <375@clio.math.lsa.umich.edu>
Source record: 251981
Cross-posted to: comp.sources.d,comp.sys.atari.st,comp.sys.ibm.pc

Full sources and documentation for ARC 5.21, with squashing & squeezing, should be appearing soon in comp.sources.unix. I suspect you MSDOS folk won't be as interested, since PKARC works so much better. However, if you like tinkering, and you've got a decent C compiler (like MSC or Turbo), you might want to look it over. (I seriously doubt that you'd want to try to use the Computer Innovations C86 compiler. There's a lot of grungy code in there trying to overcome the limitations of their library. Munging it up for MSC or TurboC would make things a lot cleaner...)

These same sources will also create the Atari ST version, assuming you've got version 3 of the Mark Williams C compiler. (Don't worry if not; there's no difference between this version and what was just posted to the ST binaries group...)

(And just for you worriers - after a month or so of persistent phone-calling, John Gilmore managed to talk to Thom Henderson and confirm the "free" status of the sources. Thanks again, John! So... Distribute at will - just don't charge for it.)

4286. Binaries news group postings

Newsgroup: comp.sys.atari.st
Date: 1988-06-19 00:50:25 UTC
From: rthurlow@van-bc.UUCP
Message-ID: <1815@van-bc.UUCP>
Source record: 251987

Well, time for one of my infrequent postings again. I just had a look at Jwahar Bammi's ZMDM binaries posted to the comp.binaries.st group, and I'm afraid it didn't make it here in very good shape. The sequence of events for this stuff is as follows:

1) The binaries came into the UUCP node I connect to, and got batched to me as if I were just another UUCP site. The articles get put in files not much larger than 100K as a rule, with all newsgroups mixed randomly and the sequence within a group not guaranteed.

2) I stuck my UUPC boot disk into my machine one day and let all the stuff come in that wanted to. Because of some (timing?) problems with the current UUPC software, I had to restart the transmission several times. This goes on for quite some time, and the days files took up a sizable part of an 800K disk, say 450K. That's quite a bit at 1200 baud with uucp g-protocol.

3) I file the disk for a few days until I get time to work on the stuff. In the interim, the binaries of course expire on the Unix machine.

4) When I finally have some spare time, I sit down with Gulam and start being an article processor. Anything interesting gets saved to RAM disk with Gulam's cut and paste. I find that the binaries are in parts too large to do easily, since Gulam can only handle 32K in its paste buffer. But it gets done.

5) I run out of RAM disk space twice while decoding, but eventually the decode works fine. Then I try to get ARC to tell me the contents of the package, and the program shows me lots of funny numbers and characters after it tells me the archive is bad.

So now I have no way to fix the thing. There was no sequence checking for any of the parts. The uuencoded binary was just chopped up by hand into 40K pieces. There is no way to detect a missing line so that I can ask for just one piece, and there is no hope of getting them all again from my Unix connection. I can try cut-and-paste again, but without the I-didn't-think-they-were-that-useful multi-part lines, I don't think it will work any better. We're pretty remote from the rest of the world up here in Vancouver in terms of net topology, and it is more of a pain than usual for me to post to the net, so I'm really reluctant to ask people to send replacements by mail. So I lose. I pay for connect time, too; usually my luck is *much* better.

My plea: if you are going to post to comp.binaries.st, PLEASE get hold of Dumas' multi-part uuencoder, and let it chop your postings into nice

tame ~30K pieces that will go through most mailers, and let it do the sequence checking and add the chaining lines so that people like me have a better chance at uudecoding correctly when it gets here properly and have a better idea of what to fix or when to give up when the group loses or mangles things. I think it is a little too much to ask the moderator to rearrange it, but I'm sure he would make happy noises if you asked him for the sources/binaries to the Dumas uu?code. And if that doesn't work, I think I can get it to you, too. The source was supposed to run great on Unix or the ST.

BTW: Jwahar, I *liked* the earlier ZMDM a lot, and used it quite regularly before I went over to getting my stuff over UUCP. Thanks from all of us for the posting, even if it didn't quite make it for me. And thanks to Howard Chu for a new ARC: I can't beleive what a handicap it was before to have an ARC that bombed when its output was redirected.

> of bits and tell which character it was.

If you use the BIOS/GEMDOS to write to the screen, the characters are in fixed positions. If you also had access to the font used, the problem is one of (bit) pattern matching. In high resolution, a screen character is contained in 16 bytes, all you have to do is match this set of 16 bytes against 256 sets in the font table. This is actually what happens in IBM-type computers when in graphics mode.

Things are a little bit more complicated if you use the DVI since the area of the screen that contains the character might be "corrupted" by other things and the character might not be normal sized.

>Fortran or Pascal??

Sorry to disappoint you, but there is no trivial way to read a character from the screen. The ST has only graphics modes, no text modes as for instance the B.B.C or the MSX line of computers (storing characters in ASCII form in Ram). The MSX uses this feature for its screen editor.

But, cheer up, there is a non-trivial way of doing it: you can match the bytes that form the character image against the TOS font(s) and return that character on a match or a space for instance if there is no match. This method was used by good ol' Sinclair Spectrum; that had a SCREEN$(row,col) function that returned the matching code for the image at (row,col). The Spectrum knew only one (graphics) mode.

I'm planning to mail a screen dump program next week to the moderator of Comp.sources.atari.st; this program matches each character screen position against the TOS font and sends it to the printer. Really nice if you would like the compiler's output that is on the screen, or an error message, or a screenfull while you are in the editor, being dumped to the printer. It is as fast as just printing the text as a file. It uses a function that matches the character bit image at the position indicated. It is written in C (major 8-), so you could translate the source to Pascal or link the compiled C module.

B.T.W. Speaking of languages, I thought you people in Nijmegen were all dedicated C/Unix hackers?

> - Ken H. Olson
>
> Henry B. Messenger (DEC can have its own opinions, I have mine)

For one minute lets look at why UNIX is becoming popular. Did
somebody say hundreds of utilites. And what is this compilers (C and Fortran)
come standard with the operating system. And could it be that even from DEC
UNIX is about a third the base price of VMS. Wow and VMS comes with what,
golly gee an assembler and some system monitors. Geese if I want to use
a compiler I have to pay how much more. You have obviously not been involved
with a company that need to get alot out of little money.

Now about using UNIX as a standard for the ST. I will admit that
UNIX is not perfect (thats how I make my living). However, we need to start
somewhere and GEM/TOS is not it. Also imagine trying to rewrite VMS for the
ST. Talk about a system eats the system. UNIX, because of a basic
simplicity runs 2 to 3 times as fast as VMS (my own bench marks ran as a
user on both operating systems running on identically configured MicroVAX
II's at 3 in the morning with nobody else on.

So untill you can come up with VMS for the ST or write VMS utilites
for the ST, please don't badmouth those people who are porting UNIX
utilites to the ST. Don't use them if you don't want to but I use them
often and really appreciate the hard work that have gone into them.

4291. Re: MWC & large arrays -- help!

Newsgroup: comp.sys.atari.st
Date: 1988-06-19 16:02:16 UTC
From: jsp@sp7040.UUCP
Message-ID: <427@sp7040.UUCP>
Source record: 251991

I have ran into this problem before to. My brother regularly corresponds with someone that helped with the 3.0 MCW developement. so here is the reason. The MWC compiler uses signed short offsets from a stack value for local variables. this means that you have 15 bits or 32K to use as an offset, question answered. This is not true of global variables. All global variables are long offset from a base address so the problem does not exist and structures and arrays can be as big as wanted.

Hope this helped. I was taught to not use global variables much but it seems that they have their place.

One common problem I have with MJC is running out of disk space.
Neither the compiler nor linker check for write errors.
A truncated .TTP file will do nothing or give you a strange TOS error.
Stack overflow is another possiblity, you can change it in ttp.s.

4293. Refreshing window text rapidly

[]
I'm working on a program that needs to manage several windows, with the
interiors filled with text. However, the text has to be in the user's
choice of point sizes (from the system fonts), since small letters are
an option I need to include in this program. (limited screen space...)
Now, the problem is, if I draw this text by setting the size with vst_height
and then draw the text with v_gtext, it takes too long to refresh the windows.
These windows need to be updated quickly. I need a way faster than v_gtext
to display text in my choice of point sizes (6 to 16)... I wouldn't mind
being limited to positioning the characters on an 80x24 grid or anything,
but I do need to be able to make then smaller. (Cconws() always seems to
make 16-point ones...)
From: kibo@pawl5.pawl.rpi.edu (James Parry)

Another way to do it (not reading the character bit maps after on the screen) would be to take over the character output routines (I don't recall what this would take), and put all the characters into an array. Of course, if your program was the only thing generating character output, it'd be more efficient to just put the characters in the array immediately. I would think that you'd have to handle the VT-52 stuff that the ST does in order to get an accurate array...

This entire approach would only be valid if the characters in question had not yet been drawn on the screen.

Recently I looked for a good assembler package for the Atari ST but I couldn't deceide which one I should buy.

Could any please give me some advise and maybe a little comparision what they perform and cost ?

Any help would be greatly appreciated !

-Axel

What is now proved was once only imagined.

UNCLE!!!UNCLE!!!UNCLE!!!

I'm being flooded with mail about my posting to this section a while back. You know, the one with 500 character lines! Sorry about the problems that may have caused some of you. This system uses auto-line wrap, so I wasn't putting in [CR's]. Are my postings getting around OK now? I started hitting return at the end of each line.

If anyone out there has seen any of my more recent postings, would you please send mail so I can verify that I'm not screwing things up out there.

Rob [1:107/330] (Fidonet adress)

Yes, I've had v2.0 for a week or 2, and I've compiled one program in
excess of 1700 lines or so with no problem. I'd like to help you but
your problem description is pretty vague (but not more so than some MR's
I've received ;-)).

I tried to compile some programs with MJC V1.2, and just got V2.0, but did
not try it yet. I also expierenced some problems (note these are all V1.2):
1. macro expansion with a trap inside get screwed
(e.g. #define Fseek(a,b,c) trap(....))
2. The stdio package is almost totally broken. I rewrote a part of it but
have not ported the changes to V2.0. Some problems:
Redirection from a shell gives big problems. MJC just supposes that
stdin and stdout are terminals if they are not redirected on its
command line. So reading from a file as stdin clobbers the file.
Besides, it doesn't use Fforce, so you end up with the wrong file
handles (no longer 0, 1) if you do redirection in the program.
Next the buffering is incomplete. fread and fwrite use unbuffered
I/O, so you can't mix them with other stdio calls, like putchar.
The files are not closed on exit, so you MUST do that yourself.
fseek also doesn't take buffering into account.
I don't know any more from the top of my head.
I'm waiting for GNU cc for the ST!

>
[14 lines deleted, says vi 8-]

I've tried to figure out the characteristics of the TOS, BIOS and
XBIOS calls as far as re-entrancy is conceirned and I came to the
following conclusions (correct me if I'm wrong, I've just disassembled
some code):

1) TOS calls are not re-entrant whatsoever. This is due to the fact
that the current registers are saved on the basepage of the current
process, and restored on exit from the call. Any TOS call from within a
TOS call would overwrite the saved registers. Also the stack pointer is
set to point to a definite area (except in the case of the Super() call).

2) BIOS and XBIOS calls (they have the same characteristics) ARE in
fact re-entrant, be it not multitasking re-entrant. The registers D3-D7
and A3-A7 are saved on a separate stack pointed to by SAVPTR ($4A2).
This pointer is updated when the registers have been saved, and also
when they have been restored (so you may see SAVPTR as a kind of stack
pointer). The problem with this scheme is that the BIOS (XBIOS) call
can get interrupted when the registers are being stored and SAVPTR is
not yet updated. When the interrupt routine now uses BIOS it gets the
old SAVPTR and will overwrite the registers on that stack. A better
approach for the save area would have been to FIRST update SAVPTR
(thereby claiming the area) and THEN save the registers.

3) It is - More or Less - possible to use (X)BIOS even from within
interrupt code. After some trying it worked (it was in fact your
article that stimulated me). So first the More (I omitted a test to
prevent re-entrance of this routine, in this case necessary but it
could be done more general, permitting re-entrance):

```
#include <portab.h>

#define SAVPTR (*(WORD **)0x4A2)

static WORD savebuf[24]; /* large enough for a PC, a SR and 10 regs */

intrupt() /* e.g. a vertical blank interrupt routine */
{
```

```
WORD *savep;

savep = SAVPTR; /* save the pointer */
SAVPTR = savebuf + sizeof(savebuf); /* point to tail of buffer */

/* here your code using (X)BIOS calls */

SAVPTR = savep; /* restore the pointer */
}
```

And now the Less: Because the code of the BIOS/XBIOS depends rather heavy on static/external data you can get into trouble. For instance if your interrupt routine uses Bconout(2,..) and your application uses Bconout(2,..) you will get a mess (unless you are able to restore all the global/static data altered).
In the case of Midiws() it is unlikely that your program uses that XBIOS call synchronous and asynchronous; and it is unlikely (but not inconceivable) that Midiws() shares updatable data with other calls (didn't check this one). The Midi user should give it a try, I think, before reinventing the wheel.
But beware of stack sizes: don't overdo it with local variables, or use a separate stack area. There could be less space on the (supervisor) stack than you think; the reason why it didn't work the first time in my case.

Leo.

If it's that hard, how is it that IBM PC's can do it? (And I do mean in graphics mode, where the characters are, just as they are on the ST, just bit patterns in memory.)

4302. Number-crunching and math chips with the Atari ST

Newsgroup: comp.sys.atari.st
Date: 1988-06-20 14:21:24 UTC
From: sidic1@watale.waterloo.edu
Message-ID: <2940@watale.waterloo.edu>
Source record: 251852
Cross-posted to: comp.sys.atari.st,comp.sys.m68k

I have a few questions concerning the Atari ST and using it for CAD/engineering work. I have heard lots of talk about coprocessors, accelerator boards and 68020/68881 boards for
other 68000 micros (ie. the AMIGA) but I haven't heard of anything for the ST (1040 or Mega).

First of all, does anyone know if anything is out there and what kind of price/performance can be expected..
Secondly, I have a bunch of software written in Fortran and currently running on IBM PC's. I would be interested in porting the software for the ST and I was first wondering if anyone has any idea of the speed I could expect from the ST compared to an XT and/or an AT? The software is basically number crunching and not graphics intensive and a typical job takes about 20 minutes to run on a garden variety 8088 PC but only 4-5 minutes with an 8087 math chip...which initially made me think about math chips for the ST.

The ST seems to have some nice features (one of them is price) and it seems to me that with a 68000
it should be at least as fast as the XT but I have never seen or heard anyone talking much about the Atari for scientific/engineering use.

I would appreciate any comments or pointers to reviews I might look at.

Thanks in advance...

4303. Re: Calling M. Braner

[]

C. Zimmer asked if BARREL can help him save an ST screen dump, upload to a (UNIX) mainframe, then print on a (color) printer. Well, BARREL will capture a screendump (upon Alt-Help) in RAM, and allow saving to disk, in 'SCODE' format. That is my own format that both compresses (somewhat) and converts to printable characters only. Thus the SCODEd file is very suitable for e-mail. The SDECODE program can decode such a file and display it on the ST. On the mainframe side I have a program called CBW2PS that decodes, then converts to Postscript for printing (C source available upon request). It is called CBW2PS since it handles monochrome screendumps only. For other kinds of printers and/or color dumps one would need to write different backends for CBW2PS (or SDECODE).

- Moshe Braner

PS: still need advice: what to do with my 7-month-old Atari SH204 hard disk that suddenly died?

4304. More mega policy from k. hedger

Newsgroup: comp.sys.atari.st

From: wayne@inmet.UUCP
Message-ID: <148900005@inmet>
Source record: 251854

I have just read the response to my posting regarding Atari's
mega-st marketing policies.

1) As for my using expletives on the network, I apologize publicly
for my language in my original posting.
2) The 'Guys at Atari' say that this policy doesn't apply to music
stores.....interesting, both of the places I talked to were music
stores. The first is a full line music store that has been selling
ST's for at least 6 months now. As soon as the MEGA'S were available,
they had them. These are the guys that told me ' uuuummmm we're
re-evaluating whether we're going to carry Atari computers anymore'
Isn't it a coincidence that this statements comes one day after
the other dealer I talked to tells me he received the letter from
Atari outlining the new policy.
3) The 'Guys from Atari' suggest that I check my facts more carefully
before posting to the net. Just exactly who am I supposed to check
with if not the 2 dealers in town that I know of ????

I can assure you that my original posting was based on information I
received from local Atari dealers as stated. If your policy is what
you say it is, then I can assure you that you have some confused dealers
in Boston , Mass.

>call for this. Does anyone knows how to handle this, preferably in
>Fortran or Pascal??
The problem of the ST is his graphic-mode where also all text
will be put out. To get a charackter from the screen, you first have
to calculate the Postion in the graphic-screen, then compare the
current 8 * 16 (or 8 * 8) field with the current systemfont. You see,
it is a lot of work, so the (nearly) only possible language is assembler.

As I know, gemdos doesn't support such a function, but perhaps
later it will do it :-).

4306. mega woes, continued

Newsgroup: comp.sys.atari.st
Date: 1988-06-20 19:59:00 UTC
From: PETCHER@FSU.BITNET
Message-ID: <[gw.scri.fsu.edu].B16E2EA0.00914A12.PETCHER>
Source record: 251856

Funny, my original letter (mega woes) of a few days ago got truncated. Perhaps some of you thought it didn't make sense the way it came out. Here is a rendition of what I meant to say in total:

What appeared was:
>
>I am not having very good luck with Mega 2's so far. Last December I purchased
>one, which was obviously buggy from day one. Typically after the machine was
> .
> .
> A story of two buggy megas out of four in our local Atari user group
> .
> .
> ending with:
>same experience with the first machine we recieved. Both had hardware
>problems. And they were not purchased in the same store, but several hundred
>miles apart.

So I continue:

Now that I have recieved my replacement mega2 and have been working with it for awhile, I have discovered that it also has problems. For one, my disk drive has the famed media change problem - whenever I take out a write enabled disk and replace it with a second write enabled disk, the disk drive doesn't recognize the media change! This was reported previously on the net to be a problem of a certain batch of Chinon drives used by third party vendors, but I did not expect to find it in the 'off-the-shelf' mega! As it turns out, I may also have other problems with the blitter (see, my letter on Uniterm vs. the blitter). Although the final analysis is not yet in, I have certainly had some mysterious crashes lately with otherwise known to be stable programs. I run the same configuration without problems on my 1040 at work and I know of others running the same programs on megas without problem. Since the mega is supposed to be essentially just a 1040 with a little more memory and a blitter in a different box it looks from my vantage point that Atari is going downhill (I am a 3 year plus user of multiple ST machines with no hardware problems to date, before the mega). Since the older machines seem to be more stable than the newer, the main point is this:

*** flame on ***

IF ATARI IS NOT ABLE TO PRODUCE STABLE HARDWARE, NO MATTER HOW THEY MARKET THEIR EQUIPMENT THEY WILL NEVER MAKE IT IN THE BUSINESS MARKET.

*** flame off ***

If I had had to depend on the mega for business I would have long ago gotten rid of it and jumped ship to something more stable. Sometimes I think that the instability of the machines is the reason that Atari doesn't market more aggressively than they do. After all, if businesses would have the experience that I have had, Atari's reputation would not be helped to put it mildly. Combine that with the recent discussion of marketing policies on the net (not to mention the many TOS bugs) and Atari has a problem. Why in our area, the closest authorized dealer including servicing is more than 200 miles away. No local dealer can meet Atari's requirements, although there are two or three that would like to sell megas (and one actually does, on a trial basis).

Don't get me wrong. I do like my Atari, and intend to do what it takes to get a workable system. It is still the best micro on the market for my purposes (support in scientific research, writing, programming) and I wish Atari every success in the business community.

Perhaps I am the victim of a wild fluctuation of statistics that occurred in the vicinity of Tallahassee and my experience is far from usual. I certainly hope so for Atari's sake.

From: devon@hcx1.SSD.HARRIS.COM
Message-ID: <46700009@hcx1>
Source record: 251857

I saw the combination at a computer faire in Worcester, MA and it
was impressive. Computereyes is a good digitizer but with the normal
limitation of colors it can only do so much and in fact grey scale
looks better than color. However, with Spectrum 512 and the program
that connects them, some really nice images can be digitized effectively.
I recommend that if you're going to buy a digitizer that you get the
whole setup with Spectrum 512, etc. or it won't be worthwhile.

There are several companies which sell adapter boards to allow
you to use a standard Adaptec-type controller board and ST-506
compatible hard drive. By far the best is from ICB, (they also
make some nice third party ST hard drive subsystems). This board
comes with good documentation, all of the necessary cabling, and
a really good formatting program to configure the board for a wide
variety of controller and disk combinations. Any Atari dealer
should be able to order this for you through CSS/Apex.

In reference to the June 14 message asking about clone hard drives for the Atari, there is an article coincidentally about that very topic in the new, i.e. July 1988, issue of STLog. The article is called "Frankendrive". Based on what the article says, it looks like you can put together your own hard drive...although I'm not convinced it is worth it. The guy put together a 30mg hard drive...the drive itself cost $265, and the price of the whole thing together ended up being $636.

>
> Jason
>"Not your average iconoclast"

i have actually done something along these lines (replacing the bios trap 13 handler with my own - in a futile attempt to buffer alcyon output to a file trouble is alcyon does not use trap13...waaahhh). it looks for any Bconout call going to dev=2 (CON:) and tee's to either a file or a buffer. it works well and _SHOULD_ be portable across ROM versions since i get the handler pointer from a sys vector. it is still kind of a kludge since i am not a 68000 as wiz, but it does work well from C (alcyon, of course :^).

if anybody wants it, i'll post it here (it is short). actually i don't know if i CAN post it since it is basically the code in ROM with 10 or 12 lines added...if atari is listening, give me the ok (it is in abacus internals and you can easily look at it with dis2nd or any other disassembler, so this should not be a problem...)

4312. 8th-Bit Prefixing Bug in UniTerm Kermit

Newsgroup: comp.sys.atari.st
Date: 1988-06-21 08:03:01 UTC
From: R_Tim_Coslet@cup.portal.com
Message-ID: <6720@cup.portal.com>
Source record: 251863

I have encountered a bug in UniTerm's Kermit File Transfer Protocol.

I thought other users of UniTerm might like to know about this Bug, so
below is a copy of the e-mail I sent to Simon Poole on the problem
I encountered.

==========
I am currently using UniTerm 2.0c 008

The UniTerm Kermit has the following bug in its 8th-Bit Prefixing
Algorithm when it is Receiving...

Other Kermit UniTerm Kermit

Mode: Sending Receiving
"S" Packet QBIN field: "&" (Prefix) "Y" (I can Prefix)

Thus the two Kermits have agreed to do 8th-Bit Prefixing.
During the transfer (about 11K Binary) the following occures...

Data in file: 26 B0 (Hex Bytes)

Other Kermit Sent: #&&0 (Ascii in "D" Packet)

UniTerm Kermit Wrote: 66 26 30 (Hex Bytes)

Somehow the UniTerm Kermit is converting (what should be) 2 Bytes
of data into 3 Bytes (also UniTerm Kermit failed to set ANY 8th-Bits
anywhere in the file it wrote!). It looks to me like UniTerm Kermit
does not recognize that it has agreed to do 8th-Bit Prefixing, and has
1) controlified the first "&" even though it isn't a "control character",
2) then saved the "&0" directly without decoding the Prefix.

The UniTerm Kermit does correctly perform 8th-Bit Prefixing
when it is Sending...

UniTerm Kermit Other Kermit

Mode: Sending Receiving
"S" Packet QBIN field: "Y" (I can Prefix) "&" (Prefix)

Thus the two Kermits have again agreed to do 8th-Bit Prefixing.
During the transfer (about 11K Binary) the following occures...

Data in file: 26 B0 (Hex Bytes)

UniTerm Kermit Sent: #&&0 (Ascii in "D" Packet)

Other Kermit Wrote: 26 B0 (Hex Bytes)

I have verified this Bug both in UniTerm 2.0c 008 and in an old UniTerm 2.0a that I still have available.

If it would be any help in debugging this problem, write me and I will send you a UUENCODED copy of the about 11K Binary file I tested it with.

Hi,
Can anyone tell me what has happened to the archive of gulam
1.03 at the lakesys archive. I sent a request for it and several other bits and
pieces most of which came back ok (much to my surprise and delight !), however
All the gulam requests were greeted with a message along the lines of ...

File not found in archive ....

I was requesting gulam103/part.uaa etc but this was on an old index
list so I guess the name may have changed. Has it , or has it been removed
from the archive ? I'm currently using a copy of Gulam I got from a PD library
(STUK) which declares itself to be Version 0.5 alpha site test, so I assumed
I was a bit out of date - is this the case or am I using the most current one
after all ? (it certainly seems relatively bug free, but maybe I'm missing
some exciting new commands!)
Alternatively, if anyone could mail me the up to date version I'd
be most grateful.

Thanks in advance for any help,

Paul.

Subject: Midi File Format

>Does anyone know how I can get a copy of the
>new Standard Midi File Format? I have heard
>that there is a standard and that several well-known
>sequencer vendors have converted to this format.
>
>I posted about this about a month ago and
>never received a response.
>
> Thanks in advance,
> - kurt

There is attempt to produce a MIDI standard. The current DRAFT standard
is 0.06, and can be obtained from:

Dave Oppenheim
Opcode Systems
1024 Hamilton Court
Menlo Park, California 94025
(415) 321-8977

I got my copy by just calling.

Some personal comments on the MIDI standard.

I have Master Tracks Pro (Atari ST). This excellent sequencer supports
two formats: Its own, and MIDI std.
Its own format saves EVERYTHING, and can be reloaded without loss of
information.
When MIDI format is reloaded, some niggly details are lost.

MIDI standard is easily implemented, IF YOU ARE A PROGRAMMER.

I have written a converter for Music Studio to MIDI STD, Master tracks (C64)
to MIDI STD, and Music construction set to MIDI STD.
The first two were straight forward; the latter requires interfacing to
SMUS-IFF, the other standard format. SMUS is in note-on-staff notation,
leaving timing to be recreated.

[of assemblers]

I have used the Metacomco assembler for a rather large project over the
last year. I have discovered no bugs or 'features' to work around.
I have not given the linker any kind of workout as the 15 or so
individually assembled modules contain *no* entry point or external
references (to maintain position independence).

I'm posting this for a friend, please note his email account expires on 7/1/88. If you'd like to contact Chris after that time, please use the snailmail address at the tail of his message.

Marty Wiedmeyer
martin@lakesys.UUCP

****

Hello my name is Chris Jeffery and I am an under-graduate at the University of Newcastle upon Tyne, UK. I hope you can help me:

I own an Atari 1040 ST (Colour and Mono system) which I use for my university work, entertainment *and* for the development of acade games to be sold around the world. My first game is due for release around the 4th of July. I would be grateful if you could put me in touch with ST users in the US who would be prepared to send me magazine reviews etc., and maybe swap hints, tips and Ideas?

The game is called Exodus, and is to be release on the Diamond Games label. It was written entirely in M68000 assembler and I would be very interested in 'meeting' other M68k freaks.

Thank you in advance,

Chris Jeffery. (fja1%ncl.turing@uk.ac.newcastle)

N.B. The mail address above is only valid until the 1st of July as at present I don't know where I will be working over the summer vac. If anyone wishes to contact me after that please use my postal address :

Chris Jeffery,
c/o 58 Chestnut Avenue,
Billericay
Essex
CM12 9JG
ENGLAND

Say, good point. Of course, no matter how bad certain corporate entities might be in this regard, it should not really justify rude or thoughtless criticism. On the other hand, they have had some pretty (dare I say it?) st*pid (they probably can't sue me for that) policies in the past, and its looking as though things may be getting worse, not better.

Well, now that I've had my two cents worth, I think I'll just stay out of this discussion, at least until Atari *REALLY* confirms (or hopefully, denies) this rumour (about the laser printers).

Message-ID: <3300007@hpcvmb.HP>
Source record: 251874

I had just renewed my subscription when I heard the same rumor. I called a phone number that I had from some subscription information and found out that it is true. Compute will soon cease to publish Compute ST. They gave me a choice to receive the regular Compute as a substitute or to get a refund. I asked for the refund and hope to see the credit on my next VISA bill. In my opinion, it is really too bad that they are discontinuing the ST version. I enjoyed their articles and the software that came with it.

-> make 16-point ones...)

you can actually replace the system fonts with your own without too much
difficulty. the pointers to the fonts can be accessed via line-A and you
can easily switch these pointers on the fly, perhaps even controlled by
your own control sequence (maybe like nroff "." commands if you like).
the bios/gemdos char output routines (i think) look for the default system
font and just draw the current char. that's how you can make your ST kinda
look like a mac (with "Chicago" font...).

From: brian@bnr-ai.UUCP
Message-ID: <237@bnr-ai.UUCP>
Source record: 251879

Recently I've been picking up development tools for my ST to start fulfilling
that promise I made to myself to use my machine for something productive :-).
I've had MWC since I got my machine 2 yrs ago (one of the reasons I got the ST)
and have ordered Beckemeyer's MT CShell.

Now, the only "major" development area I haven't touched on is the famed
"Atari Developer's Kit", I remember checking into it about a year ago and found
it came bundled with Alcyon C (which I don't need [read don't wish to pay
for]),documentation, and support for approx $300.

I'd appreciate responses from kind souls in netland who can answer any of
the following:

1. Can I get the developer's kit w/o Alcyon? Price?
2. Is the documentation and support valuable? Worth the price tag?
3. Do I pursue this through Atari Canada, or through Atari US?
4. Any other developer's tools (PD or Commercial) that would help
a prospective developer.

Note that I kid myself (and my employer) into thinking I'm a professional
programmer, so skew responses accordingly ;-). This is not for business
reasons, it's my personal "hack" machine.

I will, of course, post a summary of any tidbits I obtain.

Thanks for your indulgence!

Brian Taylor

4329. Problems with stiram desk accessory

Newsgroup: comp.sys.atari.st
Date: 1988-06-22 19:07:12 UTC
From: leilabd@cvaxa.sussex.ac.uk
Message-ID: <485@cvaxa.sussex.ac.uk>
Source record: 251880

I've just started trying to use the stiram print spooler and ramdisk accessory that was posted recently. I thought it was going to be the answer to a lot of my problems but I'm having trouble with it, even when it is the only accessory installed. When the default size printer buffer is installed, the printer just prints garbage--I would guess less than one character in ten from the file is printed. I don't really mind about that though, the real problem is that when I remove the 300K ramdisk it hardly ever gives me all the memory back--often just a few hundred miserable bytes or nothing at all.

My initial problem was that I could either have a ram disk or free memory but couldn't change easily from one state to the other. With this accessory I frequently end up with neither! Has anyone else had these problems?

Long offsets from a base address? What 68000 instruction do you have in mind?? Probably you mean absolute addresses (with relocation that is).

Lets see how we can address memory on the MC68000:

1) (An) contents of the location pointed at by An (n = 0-7)
2) -(An) same as 1) but with predecrement of An
3) (An)+ same as 1) but with postincrement of An
4) w(An) word displacement from An; w is a 16 bit signed offset.
5) b(An,Rx) byte displacement with index; b being a 8 bit signed offset.
6) There are also the PC-relative adressing modes; basically like 4) and 5)
7) Absolute short (16 bit signed)
8) Absolute long (32 bit; of course limited by a 24 bit databus).

Your local variables are typically adressed by a(A6), with a being a negative value for local variables, and a positive one for parameters. Static and global data? 1), 2) and 3) kommt nicht in frage, as it would require loading the address register for each different variable. 4) is widely used by various compilers, but means that only 64K can be addressed (GEMDOS initializes some address registers to point to the start of the initialized and uninitialized data spaces; these addresses can be found on the processes' basepage). 5) seems hardly likely, have to waste two registers.
Leaves us with 7): only for programs in low memory (or I/O references); not useful for most cases (unless you can enforce this on your program). And 8): Absolute long. Note that the address generated will be a long address relative to the start of the text segment; this becomes relocated when the program gets loaded (GEMDOS does that for you). This is the default that Lattice C uses (but you can have type 4) addressing by a compiler option).

Speaking of addressing modes, I would prefer type 4) if the data fits into 64K; the instruction is shorter and also faster than absolute addressing. If the data is over 64K you'll probably have to use absolute addressing (or else you could use something like LEA (An,Dx),Am and then

use Am; but this requires an additional overhead). There's also another case in which absolute addressing is almost mandatory: when you make an interrupt routine. When the program that sets up the interrupt vector exits (memory resident), the data base register will be destroyed. In this case I prefer absolute addresses.

> Hope this helped. I was taught to not use global variables much but >it seems that they have their place.

You can often use static variables instead of global ones; they have a more restricted scope and will be put in the same program segment(s). As for not using global variables, this is a tendency that has come forth from the structured programming gurus; I think that you may use it as a general rule. However, there are very often values/variables in your program that have a program-wide or module-wide scope; it would be both foolish and inefficient to not use that fact.

I don't li
I don't like CSD. They have a difficult setup for keys, you need to hit several to do anything. It also replots the entire screen (fast, but it still flashes irritatingly) each time you do anything. On my PC, and even under PC Ditto, I have used Power C's C-Trace. For some silly reason, they chose things like insert to set breakpoints and watchpoints, spacebar to single step, and return to exectute in trace mode instead of some obscure set of function keys. And it highlights successive lines until it actually goes off screen and can handle graphics.
I also can't see the assembly instructions, so I had to also use db separately to trace a problem - I can't see the low level in CSD. It also crashed (db too!) when I ran a problem program. I don't think they did a bad technical job with CSD - just a bad ergonomic job. I hope they fix it, because otherwise it is a good debugger. The ST's function keys just aren't the best to overload with functions, and I need both db and csd's functions in one debugger.\

I once wrote an adress immediatly after the 4 Megabytes to (physbase).
The system crashed.

The Shifter and DMA chips appear to "borrow" their adress counter from the "MMU" chip; the registers seem to be 12 bit wide (right, Atari?)

For whatever it's worth I have an old 520 expanded to one meg, and a mega 4 at home and another mega 4 at work. All three have been more reliable than the Mac's and the XT in the office, tho' the one at the office has some mystical problems with NeoDesk, getting the program icons on the desktop screwed around while I've never had any problems with the one that is mine. Both about the same age, mine two months and the office one 4 months earlier.

Just adding some data for those with a statistical bent.

4336. Midi File Format Standard Found

Newsgroup: comp.sys.atari.st
Date: 1988-06-23 01:22:40 UTC
From: kurth@sco.COM
Message-ID: <282@scolex>
Source record: 251887
Cross-posted to: rec.music.synth,comp.sys.atari.st

I received several responses to my request for the midi file
format standard. I have successfully called Opcode (see below) and been
promised a draft in the mail. I didn't talk to Dave Oppenheim, the secretary
was able to send me a copy.

I didn't call the MIDI association but I am posting the address FYI.

When I get the draft I might post a copy to the usenet if
anybody is interested and it is not too much typing. I still have
a copy of the MIDI 1.0 message standard that was posted a
little while back if anybody wants that.

One last thing, now that I have (hopefully) gotten my hands on the
file spec, does anybody out there have any recommendations for
score editors that are compatible with the standard?
I already have a sequencer and I am hoping to save a little money
by buying just a score editor.

Master tracks Pro has been mentioned as a sequencer that
accepts standard midi file format files.

- kurt

From the recommendations I received:

There is attempt to produce a MIDI (file format) standard.
The current DRAFT standard is 0.06, and can be obtained from:

Dave Oppenheim

4339. UUCP for the Atari ST

Newsgroup: comp.sys.atari.st
Date: 1988-06-23 07:46:09 UTC
From: preston@felix.UUCP
Message-ID: <43921@felix.UUCP>
Source record: 251889

Does a UUCP equivalent for the Atari ST exist?

I've seen articles in the past on this, but do not know who to ask
about the present status. (DCP, UUPC?)

Who should I ask to find out?

4340. Jove anybody?

Newsgroup: comp.sys.atari.st
Date: 1988-06-23 11:57:16 UTC
From: michael@pbinfo.uucp
Message-ID: <284@corona.pb>
Source record: 251890

Is there anybody, who has ported Jove-4.9 to the Atari ST? If so,
I would appreciate a copy very much. Or does even a GNUEmacs port
exist (:-) ??

Or is this the wrong question at all. Is there a superior editor,
one should use on the ST?

Thanks
Michael Schmidt

In article <335@bdt.UUCP> david@bdt.UUCP (David Beckemeyer) writes:
>
>Oh, and today I got a call from Sig Hartmann at Atari, <fill in today's
>title here> telling me that I'm "no longer allowed to make negative statements
>on USENET" and that he "is my sole contact for Atari related communications".

That's outrageous! Who died and made Atari God? You may have a different
developer status than I do, but I never signed anything saying that I wouldn't
badmouth Atari. In my opinion, you're perfectly justified if you laugh in
his face next time you see him. That was a very rude and unprofessional
thing for him to do (though I suppose I don't want to place the blame on
Sig without evidence -- he could have been instructed by a sinister higher-up
in the company...)

These are my opinions, and in no way reflect those of UCSC, which are wrong.

```
For those who are wondering, here's the latest index from netlib@lakesys:

------------------------------------------------------------------------------
lakesys netlib index - archives.atari - Atari ST files
------------------------------------------------------------------------------

NOTE: All files are ARCed and then uuencoded with Dumas' implementaion of
uuencode, 'uue'. It is compatable with 'uudecode', and it makes decoding
multiple part uue files very simple. The ST binaries and a DOC file are
in uuxbin.uaa.

==============================================================================

archives.atari would like to express our thanks to
Steven Goodman, Owner and System Administrator of lakesys!

==============================================================================

==========

To request files send a message to netlib@lakesys.UUCP consisting of:

send filename/part.uaa from archives.atari
send filename/part.uab from archives.atari
send filename/part.uac from archives.atari
etc.

If the file is found in one of the new volumes, (the example is volume 1) the
syntax is:

send volume1/filename/part.uaa from archives.atari
send volume1/filename/part.uab from archives.atari
send volume1/filename/part.uac from archives.atari
etc.

Note there is no space between the word "volume" and the number of the volume.

Subject for the message is not necessary.

Use the form above to assure that the parts will arrive as separate messages.
Parts are approximately 50k each.

This index can be obtained by sending:

send index from archives.atari

to netlib@lakesys.UUCP

A path which has proven to be successful for some users is:

lakesys!netlib@csd1.milw.wisc.edu

Any comments, problems or suggestions, please mail to martin@lakesys.UUCP.

4344. disk drive data disaster, part 2

Newsgroup: comp.sys.atari.st
Date: 1988-06-23 23:01:51 UTC
From: jsd@UMass.BITNET
Message-ID: <8862319013811FCAEPS@Mars.UCC.UMass.EDU>
Source record: 251894

You may or may not recall that I was having problems with frequent and inexplicable data errors on my SF 314 floppy. I received many letters, and thanks to all who wrote. The mail I received indicated that basically _anything_ could be the problem - the disk controller chip, the head alignment, dirty heads, bad disks... And the answer is - I have absolutely no idea what. The drive magically fixed itself the very day I planned to take it into a store for head alignment. This was over a week ago and it hasn't even hiccuped since. All the disks that were "unformattable" and "completely damaged" are now perfect. I have thrown out most of the really troublesome ones. My advice to those with this problem is the following: pick the drive up, shout in a loud voice: "I'm going to take my drive to the store now for alignment. Oops, looks like I won't make it in time." and slam it back down on the desk with a gentle yet firm touch. It worked for me.

4346. Compute!'s Atari ST

Newsgroup: comp.sys.atari.st
Date: 1988-06-23 23:29:25 UTC
From: ooa@scbhq.UUCP
Message-ID: <687@scbhq.UUCP>
Source record: 251896

I decided to check out what is happening at Compute! on the Atari ST today. Apparently all the rumors are correct, and Compute! has discontinued the Atari ST magazine and disk. A quick call to their 1-800-727-6937 number confirmed that distribution has stopped. I have the June/July issue, and they said that the unused portion of my subscription would be refunded, but they don't know when! Well, there goes another "Atari" product 'dropping into the ole bit bucket'! Is someone trying to send US a message? Hello, Atari, is anybody home?

Owen (never get in line with me - I never get waited on!)
UUCP ...!scbhq!ooa

STANDARD DISCLAIMER: I claim anything!! At my age I'm proud to be blamed. Now that's recognition!

4347. (none)

Newsgroup: comp.sys.atari.st

Message-ID: <8806240028.AA27106@ucbvax.Berkeley.EDU>
Source record: 251897

About three months ago I inquired about the possibilities of using my American 1040ST in Europe on 50 Hz. I received a lot of replies (thanks!) and, while most were encouraging, no one actually said, "Yeah, I've seen it work." One fellow from Atari said basically "It'll work; but to be sure, why don't you just buy some new power supplies," which wasn't the most reassuring thing to hear.

In any case, when the machine finally turned up after being lost in the mail, I plugged it into a mongo 220-to-110 V converter and, as everyone expected, it works fine, monochrome monitor and external 2S disk drive included. Beware that I received warnings that the color monitor does NOT work from 50 Hz.

If you plan on doing the same thing, you ought to think about getting a transformer in the US. I was told they exist over here, but (in Holland) I could only find little 25 watt ones. I thought I was going to have to break out the soldering iron and start attaching cables, connectors, and transformers, until someone found the exact item in a storeroom at work.

> [Rest of article deleted]
> Sid Van den Heede Voice: 416-792-1137

Version 3.0 does handle ARRAYS that are larger than 32k... I've never had any array ELEMENTS that've exceeded 32k (or any structures by themselves which were that big) so I can't verify/deny what was said about that. However, I DO know that MWC 3.0 properly handles large arrays (how large, I'm not sure)

Just for kicks and giggles, why would anyone want elements/structures that were >32k? Or, put differently, what's in it? Huge arrays? (Or 16384 ints? :)

Cross-posted to: comp.sys.m68k,comp.sys.atari.st

Hello,
Are there any pd 68k floating point routines? I need a package
with some of the following attributes:

1) works on a bare-bones 68000
2) written in assembler or C

Ideally, I'd like a complete version of the gnulib library math routines,
with support for a fpa and/or a 68020, but I'll settle for almost anything...

Thanks in advance,
Scott

Howdy Folks!
My name is Boris Schneider and I am working as a staff writer for several german computer magazines. Through a friend I heard of your fabulous conference and would like to get on it too. Of course I'll give you all important informations from germany and will answer questions to my best knowledge too.
Hope to hear from you soon.

Boris "docbobo" Schneider

4352. RE: Atari Hard disk "clones"

Newsgroup: comp.sys.atari.st
Date: 1988-06-24 12:09:00 UTC
From: HELLER@cs.umass.EDU
Message-ID: <8806250526.AA24256@ucbvax.Berkeley.EDU>
Source record: 251902

I have built my own hard drive sub-system for my 1040ST (the 520ST would be the same). This is what I did:

1) I purchased Supra's DMA to SCSI adapter from the store where I purchased my ST (cost $125.00). Contact your local Atari dealer or Supra directly for info on how to get this. There are several other companies that sell DMA to SCSI adapters for the ST.
2) I purchased via mail order an Adaptec 4000 SCSI to ST506 disk controller from The Computer Surplus Store (715 Sycamore Drive, Milpitas, CA 95035, 408-434-0168 (phone orders: 408-434-1060)). This cost me $89.00. These people also sell the Adaptex 4070 controller. The 4000 is a straight dual drive ST506 controller, the 4070 is a RLL controller (also 2 drives I believe).
3) I purchased from JameCo an IBM-PC/XT clone box & power supply (JameCo sells all of the pieces to build-your-own IBM-PC XT or AT clone - the boxes, power supplies, mother boards, etc.) The case went for about $30.00 and the power supply for about $100.00. The box is rather large and the power supply rather beefy - I plan to add a 1/4" cartidge tape drive (I already have a SCSI to QIC-36 tape drive controller). You might do with a smaller box and smaller power supply. Probably any full-height or dual 1/2 height drive box will do (use a single 1/2 height drive and put the interface board where the second 1/2 height drive would go). Priority One sells disk drive boxes, as to various other mail order companies. Check out the back of BYTE magazine and/or The Computer Shopper.
4) Ordered (from various electronics suppliers) ribbon cable (50 conductor) and connectors: 50-pin header connectors (SCSI bus), 34-pin edge connectors (hard disk interface cable), a 20-pin edge and header connecters (hard disk interface cable), and a 2-pin power connector set for the Surpa board.
5) I purchased an ST251 (40+ meg, half height hard disk) from Bull Dog computer. I think I paid about $400 for this drive. It even came with MS-DOS software for formatting and partitioning the drive (not much use to me!).

It all works. The Supra board came with Supra's hard disk utilities disk - had no trouble formatting and partitioning the drive. I have it setup with two partitions: a small (2MEG) GEM partition and a large (38+Meg) OS-9 partition (I mostly run OS-9 rather than GEM).

The Supra DMA adapter came with info on adding your own hard disk controllers and the Utilities disk had an ARC file with picture files showing the board layouts of the Supra board and seveal popular SCSI/ST506 controller boards. It is not really hard. So long as you keep track of pin one on the various connectors, you should not have trouble. Oh, one trick: 1/2 the pins on each of the ribbon cables are grounds - you will notice that

the contacts on the PC boards will have all (or most) of the pins or edge fingers wired together - this can be used to verify the that the connectors are correctly oriented. Also: on the power connector set for the Supra board - it is a good idea to wire the female end to the "live" (power supply) end. This prevents fireworks should the power be applied and the connector is just hanging loose - prevents shorting out the power supply to ground.

>
> *** flame off ***
Do not flame Atari for the unstable Blitter. This is a problem, the
semiconductor company (General Instruments?) has (the Blitter seems to
be too complicated for their machines 8-).
But *flame* *them* for using cheap sockets and circurit boards (and
noisy fans). Flame them for their circurit design (unbuffered outputs of
the soundchip to Centronics).
No, wait!!
Stop flaming them!
They could start making the hardware more stable; this would put me out
of buisiness (I'm fixing "broken" STs...8-)
>Don't get me wrong. I do like my Atari, and intend to do what it takes to get
>a workable system. It is still the best micro on the market for my purposes
Me too. I like it, but some day the fixes will be more expensive than
another ("real") machine.

4355. HP DeskJet

Newsgroup: comp.sys.atari.st
Date: 1988-06-24 16:08:00 UTC
From: FRANK@aslcl1.sdr.slb.COM
Message-ID: <8806241753.AA13224@ucbvax.Berkeley.EDU>
Source record: 251904

I just bought a HP DeskJet and thought I'd report my experiences.

1. Reviews in Current Notes and ST Applications (June) are accurate.
2. It works great with TimeWorks DTP LaserJet GDOS driver.
3. It works even better with Migraph DeskJet GDOS driver.
4. For some applications you might want the Epson FX-80 emulator
cartridge. Makes DJ work like Epson but text is 300dpi at
100cps. Its better than Epson cause compressed type is also LQ.
Graphics is only Epson quality thou with Epson cartridge.
5. Epson cartridge works fine with Epstart and Magic Sac.
6. DJ can be used in native mode for text if you use Serial driver
and Typewriter mode that comes with MS Word. Great quality type
but only one font type per document.
7. Not only is DJ FAST but it is whisper quiet. My Supra totally
drowns it out.

It so impressed my local Atari dealer that he will be carrying DeskJets.
He says he will sell them at $800 (List Price is $1000). Call Dave
at Computers to Grow (713) 777-1673 for more info.

The DeskJet is a perfect match for the ST, it works fine with all
ST memory configurations 512K and up. With a 1040, Timeworks DTP and a
DeskJet, you can have a true DeskTop Publishing System for under $2000,
although a hard disk would speed things up.

To me the DeskJet is "power without the price". As long as Atari wants $1995
for their Laser, the DeskJet offers the most price/performance!

I have no affiliation with either Computers to Grow or Hewlett Packard, other
than being a satisfied customer.

Brazil - It's only a state of mind.

4356. FATSPEED... Thanks!

Newsgroup: comp.sys.atari.st
Date: 1988-06-24 16:17:50 UTC
From: jg@hpldola.HP.COM
Message-ID: <11830006@hpldola.HP.COM>
Source record: 251905

I would like to thank Uli Kuebler for a really nice
utility, FATSPEED. It really speeds up writing
to hard disk partitions.

For example:
copy 40 files (smallest = 1KB, largest = 200KB, total size = 530KB)
from partition D: to a new directory on partition C: (partition
C: is 10MB, with about 5.4MB free).
command given at msh prompt: time "cp * c:\tmp"

without FATSPEED time returned: 0:07:27.500

with FATSPEED time returned: 0:02:58.275

That's over 2.5 times faster!!

Now for the inevitable question:
How'd ya do it??

Thanks again,
Joe Gilray (hpldola!jg)

```
Atari 520ST system for sale:
Atari 520ST computer
2 SF354 (single-sided) drives
Color Monitor

Plus the following store bought (includes boxes and manuals) software
and hardware:
Megamax C Development package
Hippo Sound Digitizer (all hardware included)
Dungeon Master
Sundog
Music Studio
The Bard's Tale
S.D.I.
Brattacus
plus MUCH more
($700+ worth of software)

also approx. 100 disks of PD, Shareware, and other software.

Asking: $700 or best offer.
(Think of it like buying the software and getting the computer
for free! ;-)

If you are interested, another $150 will buy you the Atari SF804 (ST
standard) Dot-Matrix printer and a cabinet to house the entire system.

Please contact me at jac423@leah or by replying to this message.

4358. Re: atari hard drive clones (well, not exactly diy)

Newsgroup: comp.sys.atari.st
Date: 1988-06-24 18:32:28 UTC
From: zzkj@gos.ukc.ac.uk
Message-ID: <1535@gos.ukc.ac.uk>
Source record: 251907

Well, if you want a large capacity hard drive and don't want to pay mega-pounds for it, why not try third party SCSI drive vendors. For example, last time I looked, a Supra 60Mb hard drive cost 1700 pounds including VAT. However, a 60Mb SCSI drive with 28ms access and autoparking cost me 800 pounds excl vat. (And I wasn't even looking around for price, I bought it from the first place that could supply me with a SCSI tape streamer). The cost of the power supply (a good switcher with a fan) and having it cased cost me 350 pounds (both the hard drive and the streamer needed their own cases and power supplies so halve the price if you only need the drive - this halving is an assumption). This cost included all labour and testing as I did't have the time (or the inclination) to do it myself. So, about 950 pounds for a SCSI drive, but the ST doesn't have SCSI you say. However, Supra sell their ST->SCSI card for around 80 pounds including software. So, for a total of about 1100-1200 pounds including vat you have a better cased drive and over 500 pounds more in your pocket. I know that this doesn't help those of you on a low budget, but as a developer, 500 pounds is enough to buy a spare 520 and a colour monitor.
for those of you interested, these are the suppliers I used:-
ST->SCSI converter:-
Frontier Software, Phone Harrogate (0423) 671400
Hard disk:-
Perex (now called Sintrom Electronics) Phone Reading (0734) 311088.

I sent the converter card to Perex and they installed it in the Hard drive for me. I found them to be very helpful with my initial queries. The person there that I dealt with was Mr. Richard Woods.

Disclaimer: I have no financial dealings with either of the above two companies except as a very satisfied customer. These are my own personal experiences and I merely assume that others will have an equally good response and as such I offer no guanantee of the same. So no B*tching at me if anything turns out wrong for you.

> are displayed as if they were unsigned integers. It has cut my debugging time
> in half.
>

I have to agree with this comment. Alcyon worked (with some problems)
so I tried MWC. The first version I fought often with. Version 2 I thought
was a breeze to use. With the release of 3.0 and CSD, all I can say is WOW!!!
I found bugs in the first day I had been looking at for weeks.

I did find one thing I think is a bug though, #line preprocessor
statements confuse it.

As for some of the others, I tried Lattic (Slow as snails) and
anything that requires overlays on a 68000 system can forget it. A lot
of the others I have not tried because either they were not around when I
was looking or there were horror stories about there use.

I would like to make a request for some information about the
assembler that is included with the MWC package. I use MWC alot and would
like to try some assembly. Is this much like the UNIX assembler. Is there
a macro package like M4 available for it. I have quite a bit of samplers
for a UNIX machine with a MC680X0 chip. It has always helped me to be
able to look directly at samples while trying new stuff. (Yes I realize
all hooks to the O.S. will be vastly different. When all else fails
link in libc.a and use the standard functions.

4364. Wall Street Wizard (the stock market simulation)

Newsgroup: comp.sys.atari.st
Date: 1988-06-24 22:20:09 UTC
From: forbesr@ecf.toronto.edu
Message-ID: <642@vrga.ecf.toronto.edu>
Source record: 251913

This is an unabashed advertisement for a new stock market simulation called `WALL STREET WIZARD' available for the ST. This is being privately distributed (for now) so I thought I'd let you know. An abbreviated version of the game has just appeared in the latest issue of STart magazine.

Wall Street Wizard is a stock market misulation that runs on any ST (but you need a colour monitor). The object of Wall Street Wizard is to begin with $10 000 and turn that into a million dollars in a year. Your job is to buy and sell (the way your capitalist friends do). The computer informs you of occasional market flurries and generally does its best to reproduce the market at its wildest. Industry insiders may try to sway your buying decisions but a little discernment is required. You don't have to go it alone -- three stockbrokers (Wildeyed Willy, Cautious Charlie and Nervous Norman) can be consulted with a click and a little cash. The Market index shows you how well each company is performing; well, how it has performed so far -- how it will perform is the question, isn't it?

So far, I'm told (by its creator) that Wall Street Wizard is getting rave reviews from around the world. One stock broker wrote to find out how he could buy stock -- in the game! Well, you can't yet. But you can get the full version of the game, complete with margin trading, company financial reports and three levels of play.

For ordering information, contact Tony Lovell, Lovell Marketing, 699 Eglinton Ave. West, Suite 207, Toronto, Ontario M5N 1C6, Canada. Or, heck, send your name to me. I'll pass it on to Tony.

It seems to me that you may learn how to invest all that money that you make at your job a lot more wisely after playing a few rounds of Wall Street Wizard. And, in the meantime you won't lose your proverbial ...

>>the saved cursor address.
>
>Excuse me bt i have never seen this variable location documented anywhere.
>Where is it? If it's not an official location just ignore this message.

As far as I can judge it is a constant location (in fact two), but it could probably vary from ROM to ROM (not being a system variable). But anyway, there is a clean way of doing it (that does not destroy a previous saved location): use the VDI ESC 15 function, fetch cursor position, or if you use a C library, it is probably called:

vq_curaddress(handle,&row,&col); with WORD handle,row,col. This requires a handle but in this case you can use 0 (Desktop's handle).

Furthermore I would like to offer the readers of this newsgroup the source of a module that reads a character from the screen, using the current TOS font. The relevant function is copied with slight modification from the fastdump program that was on the comp.sources.atari.st newsgroup just a while ago. If there are any objections against me posting such a long article, I would also like to hear (but then, you can always hit 'n'). As it is, the source represents a tiny demo program (just to show that it works). By removing main you get a module that can be linked with your program (about 738 bytes in size). Enjoy!

Leo

```
============================== C U T H E R E ==============================
/*
*****************************************************************************
* *
* vtchar.c version 1.0 of 25 June 1988 (C) L.J.M. de Wit 1988 *
* *
* This software may be used and distributed freely if not used commercially *
* and the originator (me) is mentioned. *
* *
*****************************************************************************
*
* This program demonstrates the reading of characters from the screen.
* The upper left quadrant of the screen is copied to the other three using
* this technique.
* If you want to use get_schar() from your own programs, just remove the
```

```
* function main() from this file and compile it as a separate module. Then
* link it with your program.
* To use it, call prep_schar() first; this sets the correct parameters
* (need to be done only once). Then you can use get_schar(r,c) with r the
* row and c the column to read from.
* An unrecognized character will be presented by a space.
* Inverse video is not yet supported (most probably it becomes a space
* now), but this is not difficult to implement.

> we're talking about non-technical opinions. This is America Jack!

Your not the only person who Atari has tried to keep quiet.
About 2 years ago Neil Harris told the sysops on one of the commercial
networks that if I didn't stop "harassing" him online he would quit showing
up. They wouldn't have a "official represenative of Atari" online anymore.
I was sent a copy of his email along with a note saying I could do what
I wanted. I continued to comment on his postings so he left for a two
months or so.

About the time he returned I started ignoring all postings from
all Atari represenatives on the networks. None of what they were saying
was worth the time it took to read it. How much vaporware can you be
expected to put up with?

4371. Re: Number-crunching and math chips with the Atari ST

Newsgroup: comp.sys.atari.st
Date: 1988-06-25 17:55:29 UTC
From: Harry_Wallace_Waddell@cup.portal.com
Message-ID: <6861@cup.portal.com>
Source record: 251921
Cross-posted to: comp.sys.atari.st,comp.sys.m68k

I am most certainly not an expert on the hardware side, i.e. the coprocessor, chip, but I have been told by "reliable sources" that it is very difficult to iterface the existing ST hardware with such a device. The Motorola 68020 user manual alludes to sofware emulation of the interface for the family of chips on the whole. Hopefully one of you hardware experts out there in ST land can enlighten us :-).

I do on the other hand have some experience with mathematical program-ing on the ST. About a year ago I wrote some optimized Discrete Fourier Trans. routines.(i.e. w/ graphics and a few bells and whistles) My results were both encouraging and discouraging.

1. I write in C. I did a fair amount of research attempting to find some PD code to assist me in my work. To put it bluntly, you are very much on your own!
2. If you like fortran you can plagarize (adapt) with impunity, but, as we all know, real mathematicians don't use FORTRAN :-).

3. Since those of us in ST land are running at a full 8 MHZ w/ a mess o' registers code optimization is "easily achieved". Even without a coprocessor life ain't all that bad if you use the tricks o' the trade i.e. intelligent mappings to lookup tables in memory, ect..

I have and do prefer personally to use my 8 MHZ machine, having it all to myself(wring hands and snicker greedily), as opposed to waiting for people with ridiculous time consuming processes to get out of my way so I can get some REAL work done.

BUT, when the 16MHZ board comes out I'll install it ASAP, w/ out hesitation! No software mods needed!

Also, one of my summer projects is to write a few math utils. If someone out there has some pd C code for mathematical programming please post them! :-)

If this outrageous and illegal crap is true (giving you a chance to back
out of it, Sig!) then Atari, who have had my wholehearted support for
eight years now, have just lost it.

Keep in mind that you (Atari) have relied on word-of-mouth to sell your
ST's, and my mouth has been as wordy as any. But I and hundreds of others
will be spreading poison on your reputation (the poison you apply yourself)
if ANY action is taken against Mr. Beckemeyer or BDT.

In the United States we are guaranteed the freedom to express our opinions.
If the Government were to ask someone what you're asking Beckemeyer it would
be a Federal crime. As it is, it is deeply deplorable and scummy.

Yes, David is a pain in the ass. Tough. Everyone has critics, and those
critics have a right to hold and express opinions. Unless you can find
something illegal in his statements, I recommend that you shut up and
behave like adults.

I have seen a shar and unshar for the ST on BIX, but don't remember
their origin. If your access to a machine that runs sh is limited,
shar and unshar are a godsend for shell archives.

>
> True of False?
>
> 1._____ Programs that use tos/gem (primitives?) for graphics will speed
> up with the blitter on.
True. Since VDI functions take advantage of the BLiTTER if it's there,
programs written to use VDI graphics primitives will show an
increase in speed in graphics operations
>
> 2._____ The desk top speeds up with the blitter on.
True. (see answer to 1. above)
>
> 3._____ Only programs written specifically with the blitter in mind
> will have any speed up.
False. (see answer to 1. above) However, programs can be written
specifically to take advantage of the BLiTTER.
>
> 4._____ All GEM programs will experience some speed up.
False. Programs that use their own techniques to draw to the screen
will not be sped up by the BLiTTER.
>
> 5._____ The new database from Timeworks is the only program currently on
> the market that uses the blitter.
False. Jim Kent's CyberPaint takes specacular advantage of the BLiTTER,
and I'm sure other examples exist (though I can't think of any
at the moment).

4375. Turning off vertical blank interrupts

Newsgroup: comp.sys.atari.st
Date: 1988-06-26 02:56:46 UTC
From: saj@chinet.UUCP
Message-ID: <5888@chinet.UUCP>
Source record: 251925

A while ago I asked what would happen if I set the interrupt level of an ST high enough to disable the vertical blank interrupt. The responses were not unanymous, but I got the idea that there should be about a 5% speed increase, against the possibility of crashing GEM. I just tried it in a computation-intensive GEM application. The good news is no crash. The bad news is only maybe a 1% speed-up. By the way: I tested that the vbl interrupt was really disabled by flipping the switch that controls whether my Thomson Ultrascan monitor is claiming to be color or mono: monitor change is detected in the vbl routine.

4376. Re: COMPUTE! ST

Newsgroup: comp.sys.atari.st
Date: 1988-06-26 05:04:26 UTC
From: Thomas_E_Zerucha@cup.portal.com
Message-ID: <6885@cup.portal.com>
Source record: 251926

I rarely bought Compute ST. Mainly because I had no way of checking out their articles without "breaking the shrinkwrap". I like to browse through a magazine before buying it to see if it really has anything useful, and a title and page number is not sufficient for a $10+ magazine. If it was good, I had no way of knowing, so I am not going to miss it. I can see why they might have needed to do something else since store owners didn't like the easy to tear out disk packages in the first issue, but STart used Tyvek envelopes (I use ceramic scissors - because I have to). Why did Compute think that people would buy their magazine without being aboe to look inside?

4377. Re: Renaming folders

From: Thomas_E_Zerucha@cup.portal.com
Message-ID: <6886@cup.portal.com>
Source record: 251927

One trick I used in a similar program was to write something that would intercept the BIOS level call and return a false "Media Changed" after changing the directory name and saving it - I used the Dfree call to see the "changed media" and the intercept would detach itself after the first time. It would always move back to the root and recognize the new directory.

>down on the desk with a gentle yet firm touch. It worked for me.

Probably something wasn't making a good connection and jaring the drive or flexing the cable fixed it. I plugged an external drive in once and it was completely inop. I disconnected the cable and reconnected it and it has worked faithfully for over 1.5 years. I never saw what might have caused this. It's a tough decision to take something apart that is brand new to make sure something isn't just loose that you can fix real easily.

Can anyone using TDI's Modula 2 help a friend of mine out with a question? He is trying to access the System Timer at location $4AB to read the count there. However he can't find a way of doing a peek or actually Long Peek. He has been trying to use the TakeALong command in Modula, but so far, two weeks, no luck.

Anyone have tried to do this before? Or in general read a memory location for either a byte or a long? Thanks in advance for any help.

George Seto

I've tested UniTerm various times on a Mega ST + Blitter (in fact a
friend uses it on a Mega + Blitter the whole time) and have never had
any problems. Supposedly there are some Blitters that show the symptoms
you describe while running 1st Word (but that's only a rumour from a German
magazine).

>Algorithm when it is Receiving...
>
Thanks for taking the trouble to report this problem and making
such a 'in depth' analysis, but as so often the reason for the effect
you are seeing is something completly different than the conclusion
you arrived at, and definitly is NOT a bug in the 8th-Bit Prefixing
Alogrithm.
> Other Kermit UniTerm Kermit
>
>Mode: Sending Receiving
>"S" Packet QBIN field: "&" (Prefix) "Y" (I can Prefix)
>
>Thus the two Kermits have agreed to do 8th-Bit Prefixing.
No, they haven't! What you CAN'T know, is that UniTerm actually
responds with the prefix character the other Kermit wants to use
if it gets the send-init packet correctlly (it only uses 'Y' if it
is initiating the transfer and doesn't need prefixing or the other
Kermit has sent 'Y' aswell (the correct meaning of 'Y' being:
I don't need to prefix, but I'll do it if you want to...), so the
problem is actually one of the following:
- UniTerm not receiving the send-init packet correctly
- UniTerm not interpreting the contents of the send-init packet
correctly
(later being rather unlikely, as it works without problems with
C-Kermit 4d and 4e (caveat: don't try it with 4e, it's got a few problems
with 8-bit prefixing), VM/CMS Kermit, VMS Kermit, Kermit-11 and MS-DOS
Kermit (I retested with exactlly the sequence you had problems with)).
To get an analysis of what is causing the problem, I need:
- a copy of the log file (packets only), the first few packets
will be enough
- Name and version of the other Kermit
- a list of all the settings of the RS232 port and Kermit.

My guess is: 'probably not'. They still own the copyrights to those programs, which may prove to be of some value. A friend of mine once wrote a computer game for Compute!, and he received royalties each time it was converted to a different computer. The fact that Compute! and company no longer support the ST does not totally eliminate the value of their copyrights.

Of course, if Compute! published a written statement making all of their ST programs public domain, then you would be perfectly correct to post them. But if Compute! remains silent, I think the wisest choice of action is to respect the original copyrights.

4385. ICONE.ARC

Newsgroup: comp.sys.atari.st
Date: 1988-06-27 01:41:00 UTC
From: euloth@dalcsug.UUCP
Message-ID: <491@dalcsug.UUCP>
Source record: 251935

Can anyone advise if they have had any problems with the posting of
Icone.arc which was made available recently on the net in binaries?
I unarc'd it but it wouldn't run. Any ideas?
Thanks.
.

> And could it be that even from DEC
> UNIX is about a third the base price of VMS.

I don't make marketing policy; if it were up to me, we wouldn't sell it at all. But if our customers want to shoot themselves in the foot, I guess we'll just have to help them.

> Wow and VMS comes with what,
> golly gee an assembler and some system monitors.

Gosh, and when UN*X even gets a system monitor, let me know!

> Geese if I want to use
> a compiler I have to pay how much more. You have obviously not been involved
> with a company that need to get alot out of little money.

Know how much programmer time costs in relation to program development tools?

> Also imagine trying to rewrite VMS for the
> ST.

I've thought about it quite often, actually. If the memory management unit had a little more guts... :-)

> Talk about a system eats the system. UNIX, because of a basic
> simplicity runs 2 to 3 times as fast as VMS (my own bench marks ran as a
> user on both operating systems running on identically configured MicroVAX
> II's at 3 in the morning with nobody else on.

Sounds like a VERY naive use of VMS, to me. Actually UN*X generally runs about 10% slower than VMS on VAXen. Remember that the VAX and VMS were developed *simultaneously* to take advantage of each other's strengths.

> please don't badmouth those people who are porting UNIX
> utilites to the ST. Don't use them if you don't want to but I use them
> often and really appreciate the hard work that have gone into them.

I appreciate the work that goes into *any* software tool (I do _that_ for a living). My comments were merely directed at the 'if it isn't UN*X, it's junk' crowd. I personally avoid UN*X, since it's in the serious dark ages compared to VMS. And going from GEM/TOS -> MINIX/X11 isn't going to help performance much...

Henry B. Messenger (DEC can have its own opinions; I have mine)

[double ditto]

Dear David,

I can fully understand why Atari is peeved at you over the tenor of your USENET postings, and I can appreciate the reasons that you have for being peeved at Atari. I am tempted, at times, to simply skip over any and all of your postings, but I don't, for one major reason. You are demonstrably a very experienced and knowledgeable Atari ST user, programmer, and developer. This gives TREMENDOUS weight to what you have to say in response to technical questions, support issues/problem areas, and how Atari and the ST is viewed within the large and growing readership of this newsgroup. So, I don't skip them, and I end up wading through an incredible morass of hate/kill Atari postings. Perhaps, you feel some satisfaction of getting a little bit "of your own" back by harming Atari Corp. sales so far as you are able. As for, "this is America Jack", you are absolutely right that you have the right to pubicly air your opinions; however, that right may be limitted in cases where, by dent of your position, influence, access, etc., you materially exert an improper influence causing culpable harm, which then may be to wit actionable.

My own experience with the 1040 ST, color monitor, Supra 20MB hard disk, Panasonic 1080i printer, has been EXTREMELY positive. The machine has more than paid for itself; or, I should say, I have produced enough work, dollar savings, and income to more than offset the investment price of the equipment. And, I personally feel that a few more articles stressing the good features, successes, configurations, and software package benefits, along with constructive criticisms would do more good and benefit for the readers of this group, for ST users and owners, and for Atari Corp., than any quantity of the foaming-at-the-mouth hysterics that we have been subjected to.

Sincerly Yours,
Chuck Werner

> ints? :)

You must be joking, or maybe your are just new to programming. Yes the problems I ran into in school could be sloved with very small amounts of memory. After all when there are 300+ people using a 1000% overloaded mainframe just how complex can you make the problems. :-)

Anyway here is a few that can require more than 32K access in arrays:

1) Zbuffer for 3D graphics
2) data logging
3) look ahead calcuation done to increase speed
4) speed sheets
5) decent word processor
6) music
7) ram disk
on and on

Almost any type program can benefit from the "EASY" access of memory. When one has a high level compiler why should he have to worry about array sizes as long as there is enough real memory.

I forget if it was listed here, but the new TOS ROMs can rename directories using the Frename system call. The desktop now lets you edit the directory name when you "show info" on a directory, just like on a file. You can't use Frename to move directories around in the tree, however, the way you can a file. (I may fix that before the ROMs go out...)

Wow! I didn't really believe that I'd get a real answer to that question.
Thanks, Ken. (Too bad its not a toll-free number, but it would likely do me
little good here in Canada anyway.)

Perhaps now we can get somebody at Atari to make an official and definitive
statement regarding their policies with respect to the Megas and the Laser
Printer. I just called the number above, and my call seems to have been forwarded
to /dev/null (i.e. a busy signal, then a broken connection). I guess that until
I try once more (I'm an underpaid student and can't afford expensive long-
distance calls) I shall refrain from calling such policy "brain-damaged",
"mindless", "suicidal" or anything else nasty. (At least I tried!)

(I'm still hoping to hear an official denial of Atari's rumoured policy to
sell Laser Printers bundled with ALL Mega ST's except at music stores, so
that I can safely avoid the necessity of actually using all these nasty
words and phrases that I have thought up...)

In any event, it is (genuinely) nice to see Atari again responding with
resonable answers to reasonable (albeit inconsequential) questions. Now,
lets get some REAL answers...

Atari: Am I, or am I not, expected to purchase a laser printer with my
next computer, even though I do not want one?

Accidentally I'm working on 3D projection and motion for the ST right
now (rotation, reflection, translation etc.). I use 4D homogene
coordinates to achieve things, so each movement can be presented by
applying a matrix multiplication to an object (in fact to the 4x4
matrix that puts the object in space). Apart from one function that is
in assembly (matrix multiplication) all stuff is in C. If there is
enough interest, I'll post it. It works already, but I want it to be faster
still (speed++), although it can handle wire models real-time.

Anyone interested, send me a mail, specifying where I should put the stuff
(this newsgroup, comp.sources.atari.st or e-mail).

Leo (the mathemagician).

Thanks, Dan.

What *really* happened was that there was quite a bit of name calling going on. Dan seemed to have blamed me personally for some financial woes connected with the takeover of Atari. He lost quite a bit of money because the contract with Synapse for Synfile (which Dan co-wrote) was dropped.

Now I think it's a shame that Dan ran into this kind of problem. But he knew darn well that I had nothing to do with it (the problem occurred before I even joined Atari), but he was using me as a convenient scapegoat. So I asked the sysops to get a handle on the namecalling. That's a sysop's job.

Once Dan and I met personally, I think he calmed down a bit and realized that I was not some ogre out to get him.

Maybe we ought to get together again so he won't forget.

Most of the professional online systems won't put up with that sort of thing. It's a free country, thank goodness -- but paying users of an online system tend to object to that kind of stuff.

Tja, what is the "current cursor position" on a bitmap screen using a
proportional spaced font? Whats a Cursor anyway? :-)
>
>Just to reduce the damper put on that idea, that's exactly what Acorn's
>BBC Micro did: there was a system call to read the bits under the current

Puh!
The Acorn machines are very well thought about. Before sold (if sold
at all :-)

>The BBC Micro was a 6502 8-bit machine running at standard speed (1MHz?):
>I'm sure a 68000 can do as well!
Remember: the 68000 is just twice to 3 times as fast as a 6502 (I still
love my Apple][!)

Comp.sys.atari.st just gave me a little C program to do just that:
compare the bitmap on the screen with the ROM-Font (witch ist not
proportional :-).

1. PC Ditto

I just got it. Great hack!! I would not recommend it to anyone
who does not have a hard disk though (I am currently running off a single
sided 3.5")

Does anyone know how to get a ramdisk working with this?
(these guys could make lots of money if they wrote a better manual, ported
it to the Mac and charged $199)

2. Circuit Maker

Just got this too. Crashes when ever I try to load one of the sample circuits
on the disk. (V.1) Does anyone know of a newer version? Would anyone like
to start a mailing list so that we can exchange circuits (they are text files)
I would be glad to moderate the mailing list. Mail to me if you are interested.

3. ICONE

I can't get the version for the old ROMs to work either, has anyone got a
working version they can send me?

Thanks

> will not be sped up by the BLiTTER.

How could a program which is _GEM_ not speed up? Seeing as the blitter
(As I understand how it works) speeds up the Line-A type stuff, and seeing as
GEM uses Line-A, wouldn't all GEM programs inherently be sped up? (Depending,
of course, on how much of it was GEM and how much was custom drawing).

> >

> at the moment).

I'm not entirely sure about the exact direction of the original
question, but: Those programs may be the only ones that EXPLICITLY use the
blitter, but all programs that don't use all custom output drivers would use
it if available, no?

>
> Wayne Knapp

Nope, being doing it for a little while... (Primarily on micros, which affects ones mindset regarding memory).

But, I don't see why anything mentioned would have to have >32K ELEMENTS. One could easily enough (and, possibly, more conveniently, depending on how one was handling one's memory allocation) have a pointer to an array imbedded in a structure. I suppose my not being able to see why is pretty much irrelevant, as if someone wants to do something, they should be able to...

"High level compiler"? C, the most popular bloated macro assembler? :)

Jason - Not your average iconoclast.

4416. Re: MWC & large arrays -- help!

Newsgroup: comp.sys.atari.st

From: braner@batcomputer.tn.cornell.edu
Message-ID: <5327@batcomputer.tn.cornell.edu>
Source record: 251816

[]

I think the original question was _not_ naive: why would one need
a _structure_ (rather than an array) that is more than 32K in size?
That's what many 68000 compilers cannot handle: structure fields
that are offset more than 32K from the beginning of the structure.
That's because a field in a structure is accessed by adding an offset
(a constant calculated at compile time) to the base address. On the
68000, the obvious, compact, efficient method is to use the indexed
addressing mode, but that limits you to an offset of +-32K.
That is very different from _array_ access, which (usually) involves
a calculation at run time: the address of a[i] is base_of_a[] +
i * sizeof (element of a[]). That's slower. If you want a structure
like:

```
struct humongous {
int dis;
int data[1000000];
float dat;
}
```

you'll have a problem with most compilers (the offset of 'dat' is too large).
But you can do it like this:

```
struct not_so_humongous {
int dis;
int *data;
float dat;
}
```

where 'data' is just a pointer and you set it to point to the array that
is allocated separately. What you win is far greater efficiency when
accessing more typical structures.

Of course, a _very_ smart compiler could switch from one addressing mode
to another depending on the size of a structure.

Note concerning the opposite from structures of arrays: arrays of structures.
You might certainly want to use a very large array of many small structures.
Laser C has a bug in doing pointer arithmetic on pointers to structures, as
I have posted a while ago. In short, struct mystruct a[i] works fine, even
for i very large, but struct mystruct *p; p += i; fails (uses the wrong
address) if (i * sizeof (mystruct) > 64K) and i is an int. So use
p = &p[i]; instead. This bug holds for arrays of _structures_ only.

> Chuck Werner

Mr. Werner, please do not create new libel laws where none exist.

Mr. Beckemeyer's statements are actionable if he a) violates a contract
he had with Atari to not criticize them or divulge certain information
which he then divulges (and I doubt such a contrcat exists, but for
the sake of argument I'll admit the possibility), or b) he commits
libel. Now libel involves knowingly making a public false statement
that causes harm. If I say something that causes harm but it's true,
then it's not actionable. If I say something false but it's harmless,
then any libel judgement would be rather limited! If I say something
false and cause harm, then I'm potentially in trouble.

Consult a lawyer for details; I remember the above from my undergrad
Con Law classes.

Dave, keep up the good work!

> press for not covering the Atari machines enough.

There was a long panel discussion held at West Coast Computer Faire in March.
My talk centered on the reasons why computers in the home had not caught on
to the big extent expected in the earlier part of the decade -- people
rarely use the computer for purposes like personal finance, for example.

I postulated that advances in technology would change this. For example,
imagine a scanner which could read text and put it into the appropriate
place in a database. So you could feed in your checkbook and it would
create your budget information automatically. With faster processors,
better AI software, and cheaper scanners (all reasonable to expect within
the next few years) this could be a real product.

Without this, home finance is a painful operation, involving many hours of
drudgery keying in the information.

Office computing has taken off because the office has a labor force
available to handle this kind of job. The home needs more powerful
technology.

<sigh> Pick on the press and see where it gets you...

```
Path: mfgfoc!exodus
From: exodus@mfgfoc.UUCP (Greg Onufer)
Newsgroups: comp.sys.atari.st
Subject: Bug in MWC found by TeX
Keywords: array of structs with long index
Message-ID: <358@mfgfoc.UUCP>
Date: 28 Jun 88 16:44:47 GMT
Organization: FOCUS Semiconductor Sys., Sunnyvale, CA
Lines: 34

A bug in MWC 3.0 found by TeX!! One step closer.....

There is a bug in the MW C Code Generator as follows:

foo[bar] = foobar;

will not work if foo is an array of structures, foobar is a structure,
and bar is a long. The code produced will:
- Load the address of foobar into a1
- push sizeof(foobar) onto the stack
- push bar onto the stack
- call lrmul to multiply the two and obtain offset
- load the address of foo+offset into a0
- copy the struct's

[a little simplified in that MWC copies the structs using pre-decrement
and a1,a0 actually point beyond the end of the structure to take that
into account]

except that a1 is munged by lrmul and no longer contains the address
of foobar. The fix is to get lrmul.o out of libc.a, disassemble it
with db, and rewrite it so that it saves a1 upon entry and restores
it upon exit. MW is working on their fix right now.

A while ago I sent a letter which started out:

>When I run Uniterm 2.0c on my mega 2 with the blitter on, the program hangs up
>or crashes. But if I turn off the blitter everything goes fine. I typically

As it turns out, I was premature in my judgement that everything was fine without the blitter. After awhile, even when the blitter was turned off Uniterm froze up. So I began to investigate further, and to my amazement the problem apparently resides in the mainframe software (an interactive database for a library catalog) and not anywhere on the Atari end at all! Those in charge of this database admit that it is still unstable and that this problem has also occurred in other cases. When connected to anything other than this database, my mega, Uniterm and the blitter so far continue to happily coexist and go merrily humming along. Sorry about the false alarm.

Thanks to those of you who responded to my original query, confirming your exeriences that Uniterm works well with a working blitter.

Don Petcher

>Kermit (I retested with exactlly the sequence you had problems with)).
>To get an analysis of what is causing the problem, I need:
> - a copy of the log file (packets only), the first few packets
> will be enough
I will do this when I can, but as neither Kermit (UniTerm or the Other one)
do logging to files I can't do it at this time. I will add debug packet
logging to the other Kermit eventually. By the way, the data I gave you
from the QBIN fields came from DEBUG messages printed by the other Kermit
but as it did not write a file I only showed the "relavent" data, to save
typing.

> - Name and version of the other Kermit
The other Kermit is Kermit-UCSD. I am currently in the process of upgrading
this Primitive Kermit to full capabilities. As of right now it has no
version number.

> - a list of all the settings of the RS232 port and Kermit.
I will also forward this to you as when I get logging added and can
provide full information. However the most important thing is that the
Kermit-UCSD is running with "Space Parity" as I have trouble with
setting the machine's serial port I/O drivers to pass all 8-Bits.

Thank you for responding promptly to my Bug Report.

By the way, there was a recent posting to the effect that it is illegal in the
US to prohibit disassembly of code sold or licensed if the disassembly was for
the purpose of using the software (do you do anything that is totally useless?)
-- a reasonable extrapolation is that it would also be legal to sell a copy of
the disassembly to someone who wanted to use the disassembled software -- though
I'm not sure about how reasonable a bunch of lawyers would be! [I am refering
to the Quaid Software case.] In that case, Atari and DRI have no say on the
issue. As a corrilary, many years ago a company published a disassembly of the
TRS-80 ROMs, printing only text (no hex codes) so as to avoid "translating" the
contents of the copyrighted ROMs -- neither Microsoft nor Tandy did anything
about it, so there is some precident (again in the USA -- German law may be
quite different).

One common problem I have with MJC is running out of disk space.
Neither the compiler nor linker check for write errors.
A truncated .TTP file will do nothing or give you a strange TOS error.
Stack overflow is another possiblity, you can change it in ttp.s.

X-VMS-Mail-To: CCNET%"info-atari16@score.stanford.edu"

Funny, my original letter (mega woes) of a few days ago got truncated. Perhaps
some of you thought it didn't make sense the way it came out. Here is a
rendition of what I meant to say in total:

What appeared was:
>
>I am not having very good luck with Mega 2's so far. Last December I purchased
>one, which was obviously buggy from day one. Typically after the machine was
> .
> .
> A story of two buggy megas out of four in our local Atari user group
> .

> .
> ending with:
>same experience with the first machine we recieved. Both had hardware
>problems. And they were not purchased in the same store, but several hundred
>miles apart.

So I continue:

Now that I have recieved my replacement mega2 and have been working with it for awhile, I have discovered that it also has problems. For one, my disk drive has the famed media change problem - whenever I take out a write enabled disk

and replace it with a second write enabled disk, the disk drive doesn't recognize the media change! This was reported previously on the net to be a problem of a certain batch of Chinon drives used by third party vendors, but I did not expect to find it in the 'off-the-shelf' mega! As it turns out, I may also have other problems with the blitter (see, my letter on Uniterm vs. the blitter). Although the final analysis is not yet in, I have certainly had some mysterious crashes lately with otherwise known to be stable programs. I run the same configuration without problems on my 1040 at work and I know of others running the same programs on megas without problem. Since the mega is supposed to be essentially just a 1040 with a little more memory and a blitter in a different box it looks from my vantage point that Atari is going downhill (I am a 3 year plus user of multiple ST machines with no hardware problems to date, before the mega). Since the older machines seem to be more stable than the newer, the main point is this:

*** flame on ***

IF ATARI IS NOT ABLE TO PRODUCE STABLE HARDWARE, NO MATTER HOW THEY MARKET THEIR EQUIPMENT THEY WILL NEVER MAKE IT IN THE BUSINESS MARKET.

*** flame off ***

If I had had to depend on the mega for business I would have long ago gotten rid of it and jumped ship to something more stable. Sometimes I think that the instability of the machines is the reason that Atari doesn't market more aggressively than they do. After all, if businesses would have the experience that I have had, Atari's reputation would not be helped to put it mildly. Combine that with the recent discussion of marketing policies on the net (not to mention the many TOS bugs) and Atari has a problem. Why in our area, the closest authorized dealer including servicing is more than 200 miles away. No local dealer can meet Atari's requirements, although there are two or three that would like to sell megas (and one actually does, on a trial basis).

Don't get me wrong. I do like my Atari, and intend to do what it takes to get a workable system. It is still the best micro on the market for my purposes (support in scientific research, writing, programming) and I wish Atari every success in the business community.

Perhaps I am the victim of a wild fluctuation of statistics that occurred in the vicinity of Tallahassee and my experience is far from usual. I certainly hope so for Atari's sake.

Subject: Binaries news group postings
To: info-atari16@score.stanford.edu

Well, time for one of my infrequent postings again. I just had a look at Jwahar Bammi's ZMDM binaries posted to the comp.binaries.st group, and I'm afraid it didn't make it here in very good shape. The sequence of events for this stuff is as follows:

1) The binaries came into the UUCP node I connect to, and got batched to me as if I were just another UUCP site. The articles get put in files not much larger than 100K as a rule, with all newsgroups mixed randomly and the sequence within a group not guaranteed.

2) I stuck my UUPC boot disk into my machine one day and let all the stuff come in that wanted to. Because of some (timing?) problems with the current UUPC software, I had to restart the transmission several times. This goes on for quite some time, and the days files took up a sizable part of an 800K disk, say 450K. That's quite a bit at 1200 baud with uucp g-protocol.

3) I file the disk for a few days until I get time to work on the stuff. In the interim, the binaries of course expire on the Unix machine.

4) When I finally have some spare time, I sit down with Gulam and start being an article processor. Anything interesting gets saved to RAM disk with Gulam's cut and paste. I find that the binaries are in parts too large to do easily, since Gulam can only handle 32K in its paste buffer. But it gets done.

5) I run out of RAM disk space twice while decoding, but eventually the decode works fine. Then I try to get ARC to tell me the contents of the package, and the program shows me lots of funny numbers and characters after it tells me the archive is bad.

So now I have no way to fix the thing. There was no sequence checking for any of the parts. The uuencoded binary was just chopped up by hand into 40K pieces. There is no way to detect a missing line so that I can ask for just one piece, and there is no hope of getting them all again from my Unix connection. I can try cut-and-paste again, but without the I-didn't-think-they-were-that-useful multi-part lines, I don't think it will work any better. We're pretty remote from the rest of the world up here in Vancouver in terms of net topology, and it is more of a pain

than usual for me to post to the net, so I'm really reluctant to ask people to send replacements by mail. So I lose. I pay for connect time, too; usually my luck is *much* better.

My plea: if you are going to post to comp.binaries.st, PLEASE get hold of Dumas' multi-part uuencoder, and let it chop your postings into nice tame %30K pieces that will go through most mailers, and let it do the sequence checking and add the chaining lines so that people like me have a better chance at uudecoding correctly when it gets here properly and have a better idea of what to fix or when to give up when the group loses or mangles things. I think it is a little too much to ask the moderator to rearrange it, but I'm sure he would make happy noises if you asked him for the sources/binaries to the Dumas uu?code. And if that doesn't work, I think I can get it to you, too. The source was supposed to run great on Unix or the ST.

BTW: Jwahar, I *liked* the earlier ZMDM a lot, and used it quite regularly before I went over to getting my stuff over UUCP. Thanks from all of us for the posting, even if it didn't quite make it for me. And thanks to Howard Chu for a new ARC: I can't beleive what a handicap it was before to have an ARC that bombed when its output was redirected.

If it's that hard, how is it that IBM PC's can do it? (And I do mean in graphics mode, where the characters are, just as they are on the ST, just bit patterns in memory.)

C. Zimmer asked if BARREL can help him save an ST screen dump, upload
to a (UNIX) mainframe, then print on a (color) printer. Well, BARREL
will capture a screendump (upon Alt-Help) in RAM, and allow saving to
disk, in 'SCODE' format. That is my own format that both compresses
(somewhat) and converts to printable characters only. Thus the SCODEd
file is very suitable for e-mail. The SDECODE program can decode such
a file and display it on the ST. On the mainframe side I have a program
called CBW2PS that decodes, then converts to Postscript for printing
(C source available upon request). It is called CBW2PS since it handles
monochrome screendumps only. For other kinds of printers and/or color
dumps one would need to write different backends for CBW2PS (or SDECODE).

Subject: atari hard drive clones

In reference to the June 14 message asking about clone hard drives for
the Atari, there is an article coincidentally about that very topic in
the new, i.e. July 1988, issue of STLog. The article is called
"Frankendrive". Based on what the article says, it looks like you can
put together your own hard drive...although I'm not convinced it is
worth it. The guy put together a 30mg hard drive...the drive itself
cost $265, and the price of the whole thing together ended up being
$636.

Check for sources of magnetic fields in the neibouhood of your SM124.

My Philips color monitor, Atari pover supply, Epson printer (and so on)
got moved far away of my SM124 for that reason.

Subject: Re: MWC & large arrays -- help!
To: info-atari16@score.stanford.edu

I have ran into this problem before to. My brother regularly
corresponds with someone that helped with the 3.0 MCW developement. so
here is the reason. The MWC compiler uses signed short offsets from a
stack value for local variables. this means that you have 15 bits or
32K to use as an offset, question answered. This is not true of global
variables. All global variables are long offset from a base address so
the problem does not exist and structures and arrays can be as big as
wanted.

Hope this helped. I was taught to not use global variables much but
it seems that they have their place.

> "UNIX compatibility is snake oil."
> - Ken H. Olson
>
> Henry B. Messenger (DEC can have its own opinions, I have mine)

For one minute lets look at why UNIX is becoming popular. Did
somebody say hundreds of utilites. And what is this compilers (C and Fortran)
come standard with the operating system. And could it be that even from DEC
UNIX is about a third the base price of VMS. Wow and VMS comes with what,
golly gee an assembler and some system monitors. Geese if I want to use
a compiler I have to pay how much more. You have obviously not been involved
with a company that need to get alot out of little money.

Now about using UNIX as a standard for the ST. I will admit that
UNIX is not perfect (thats how I make my living). However, we need to start
somewhere and GEM/TOS is not it. Also imagine trying to rewrite VMS for the
ST. Talk about a system eats the system. UNIX, because of a basic
simplicity runs 2 to 3 times as fast as VMS (my own bench marks ran as a
user on both operating systems running on identically configured MicroVAX
II's at 3 in the morning with nobody else on.

So untill you can come up with VMS for the ST or write VMS utilites
for the ST, please don't badmouth those people who are porting UNIX
utilites to the ST. Don't use them if you don't want to but I use them
often and really appreciate the hard work that have gone into them.

Having had a small problem recently with this program that is in
Comp.sources.atari.st (address error on exit of other - GEM - program)
I have added a fix. The reason seems to be that when some GEM programs
terminate they are using the GEM-exit vector, and the exit routine
still relies on A4 having a valid contents (I'm not sure). After I
modified the code to save A4 on the stack the problem disappeared.

Here is the relevant part of the code (comments omitted), with 2
instructions added:

```
DTOPWAIT
MOVE.L $602C,A0
MOVEQ.L #0,D1

>his response was 'good point'.

I don't know where these dealers got their information, but I work at
an Atari dealership near Boston and know we still can purchase Mega STs
without their laser printers/hard drive/software. I believe people are
confusing Atari's NEW OFFER to sell these ``bundles'' at special prices.
I have confirmed this with the store owner: Dealers can buy the Megas
packaged with: SLM804 Laser Printer, Hard Disk (New Megafiler 20), Mega
ST (either 2 or 4), VIP Professional, MS-Write, and others misc. programs.

This --Ultimate Desktop Publishing System-- IS NOT being forced down
everyones throat... We just got in a shipment consisting of four of these
packages, and based on the price we're selling them at, I know this is a
GREAT deal. (Roughly $2000 for Mega4, $1000 for Laser, and free software).

Would someone from Atari PLEASE try to straighten this matter out!?

> of bits and tell which character it was.

If you use the BIOS/GEMDOS to write to the screen, the characters are
in fixed positions. If you also had access to the font used, the problem
is one of (bit) pattern matching. In high resolution, a screen character
is contained in 16 bytes, all you have to do is match this set of 16 bytes
against 256 sets in the font table. This is actually what happens in
IBM-type computers when in graphics mode.

Things are a little bit more complicated if you use the DVI since the
area of the screen that contains the character might be "corrupted"
by other things and the character might not be normal sized.

I have to say that I don't go for those kinds of words in a USENET posting,
but I sure can identify with the frustration that was behind that
posting. And to have someone at Atari complaining about this is a little
odd (don't you have more important work to do, Mr. Good?. It seems that the
only way lately to get you, or anyone else at Atari, to comment, is to

use these words...)

Why should they be "punished" (e.g. forced to purchase an over-priced, under-featured laser printer and then try to foist it onto an unsuspecting customer)? If the laser printer is such a dog (as it seems to be), why don't you "guys at Atari" just shut up and eat them quietly?

Well I know the problem exists with the version of SH204 that I bought (full price of $800!) two years ago. It's a bug in the PAL. I got a fix for it from Berkeley Micro Systems (415) 465-6956. The BMS fix consists of a replacement PAL which plugs in a socket on the SH204 host adapter board. I've been using the BMS PAL for several months with absolutely no problems.

Disclaimer: I am not tied to BMS, except that in the past I have sold their BMS-100 host adapters to some of my customers.

Sorry to disappoint you, but there is no trivial way to read a character from the screen. The ST has only graphics modes, no text modes as for instance the B.B.C or the MSX line of computers (storing characters in ASCII form in Ram). The MSX uses this feature for its

screen editor.

But, cheer up, there is a non-trivial way of doing it: you can match the bytes that form the character image against the TOS font(s) and return that character on a match or a space for instance if there is no match. This method was used by good ol' Sinclair Spectrum; that had a SCREEN$(row,col) function that returned the matching code for the image at (row,col). The Spectrum knew only one (graphics) mode.

I'm planning to mail a screen dump program next week to the moderator of Comp.sources.atari.st; this program matches each character screen position against the TOS font and sends it to the printer. Really nice if you would like the compiler's output that is on the screen, or an error message, or a screenfull while you are in the editor, being dumped to the printer. It is as fast as just printing the text as a file. It uses a function that matches the character bit image at the position indicated. It is written in C (major 8-), so you could translate the source to Pascal or link the compiled C module.

B.T.W. Speaking of languages, I thought you people in Nijmegen were all dedicated C/Unix hackers?

Another way to do it (not reading the character bit maps after on the screen) would be to take over the character output routines (I don't recall what this would take), and put all the characters into an array. Of course, if your program was the only thing generating character output, it'd be more efficient to just put the characters in the array immediately. I would think

that you'd have to handle the VT-52 stuff that the ST does in order to get an accurate array...

This entire approach would only be valid if the characters in question had not yet been drawn on the screen.

Subject: Refreshing window text rapidly
To: info-atari16@score.stanford.edu

[]
I'm working on a program that needs to manage several windows, with the interiors filled with text. However, the text has to be in the user's choice of point sizes (from the system fonts), since small letters are an option I need to include in this program. (limited screen space...)
Now, the problem is, if I draw this text by setting the size with vst_height and then draw the text with v_gtext, it takes too long to refresh the windows.

These windows need to be updated quickly. I need a way faster than v_gtext
to display text in my choice of point sizes (6 to 16)... I wouldn't mind
being limited to positioning the characters on an 80x24 grid or anything,
but I do need to be able to make then smaller. (Cconws() always seems to
make 16-point ones...)

Yes, I've had v2.0 for a week or 2, and I've compiled one program in
excess of 1700 lines or so with no problem. I'd like to help you but
your problem description is pretty vague (but not more so than some MR's
I've received ;-)).

I tried to compile some programs with MJC V1.2, and just got V2.0, but did
not try it yet. I also expierenced some problems (note these are all V1.2):
1. macro expansion with a trap inside get screwed
(e.g. #define Fseek(a,b,c) trap(....))
2. The stdio package is almost totally broken. I rewrote a part of it but
have not ported the changes to V2.0. Some problems:
Redirection from a shell gives big problems. MJC just supposes that
stdin and stdout are terminals if they are not redirected on its
command line. So reading from a file as stdin clobbers the file.
Besides, it doesn't use Fforce, so you end up with the wrong file
handles (no longer 0, 1) if you do redirection in the program.
Next the buffering is incomplete. fread and fwrite use unbuffered
I/O, so you can't mix them with other stdio calls, like putchar.
The files are not closed on exit, so you MUST do that yourself.
fseek also doesn't take buffering into account.
I don't know any more from the top of my head.
I'm waiting for GNU cc for the ST!

[14 lines deleted, says vi 8-]

I've tried to figure out the characteristics of the TOS, BIOS and XBIOS calls as far as re-entrancy is conceirned and I came to the following conclusions (correct me if I'm wrong, I've just disassembled some code):

1) TOS calls are not re-entrant whatsoever. This is due to the fact that the current registers are saved on the basepage of the current process, and restored on exit from the call. Any TOS call from within a TOS call would overwrite the saved registers. Also the stack pointer is set to point to a definite area (except in the case of the Super() call).

2) BIOS and XBIOS calls (they have the same characteristics) ARE in fact re-entrant, be it not multitasking re-entrant. The registers D3-D7 and A3-A7 are saved on a separate stack pointed to by SAVPTR ($4A2). This pointer is updated when the registers have been saved, and also when they have been restored (so you may see SAVPTR as a kind of stack pointer). The problem with this scheme is that the BIOS (XBIOS) call can get interrupted when the registers are being stored and SAVPTR is not yet updated. When the interrupt routine now uses BIOS it gets the old SAVPTR and will overwrite the registers on that stack. A better approach for the save area would have been to FIRST update SAVPTR (thereby claiming the area) and THEN save the registers.

3) It is - More or Less - possible to use (X)BIOS even from within interrupt code. After some trying it worked (it was in fact your article that stimulated me). So first the More (I omitted a test to prevent re-entrance of this routine, in this case necessary but it could be done more general, permitting re-entrance):

```
#include <portab.h>

#define SAVPTR (*(WORD **)0x4A2)

static WORD savebuf[24]; /* large enough for a PC, a SR and 10 regs */

intrupt() /* e.g. a vertical blank interrupt routine */
,
WORD *savep;
```

```
savep = SAVPTR; /* save the pointer */
SAVPTR = savebuf + sizeof(savebuf); /* point to tail of buffer */

/* here your code using (X)BIOS calls */

SAVPTR = savep; /* restore the pointer */
```
-

And now the Less: Because the code of the BIOS/XBIOS depends rather heavy on static/external data you can get into trouble. For instance if your interrupt routine uses Bconout(2,..) and your application uses Bconout(2,..) you will get a mess (unless you are able to restore all the global/static data altered).
In the case of Midiws() it is unlikely that your program uses that XBIOS call synchronous and asynchronous; and it is unlikely (but not inconceivable) that Midiws() shares updatable data with other calls (didn't check this one). The Midi user should give it a try, I think, before reinventing the wheel.
But beware of stack sizes: don't overdo it with local variables, or use a separate stack area. There could be less space on the (supervisor) stack than you think; the reason why it didn't work the first time in my case.

Leo.

>"Not your average iconoclast"

i have actually done something along these lines (replacing the bios trap 13 handler with my own - in a futile attempt to buffer alcyon output to a file trouble is alcyon does not use trap13...waaahhh). it looks for any Bconout call going to dev=2 (CON:) and tee's to either a file or a buffer. it works well and _SHOULD_ be portable across ROM versions since i get the handler pointer from a sys vector. it is still kind of a kludge since i am not a 68000 as wiz, but it does work well from C (alcyon, of course :~).

if anybody wants it, i'll post it here (it is short). actually i don't know if i CAN post it since it is basically the code in ROM with 10 or 12 lines added...if atari is listening, give me the ok (it is in abacus internals and you can easily look at it with dis2nd or any other disassembler, so this should not be a problem...)

To: info-atari16@score.stanford.edu

I saw the combination at a computer faire in Worcester, MA and it
was impressive. Computereyes is a good digitizer but with the normal
limitation of colors it can only do so much and in fact grey scale
looks better than color. However, with Spectrum 512 and the program
that connects them, some really nice images can be digitized effectively.
I recommend that if you're going to buy a digitizer that you get the
whole setup with Spectrum 512, etc. or it won't be worthwhile.

There are several companies which sell adapter boards to allow
you to use a standard Adaptec-type controller board and ST-506
compatible hard drive. By far the best is from ICB, (they also
make some nice third party ST hard drive subsystems). This board
comes with good documentation, all of the necessary cabling, and
a really good formatting program to configure the board for a wide
variety of controller and disk combinations. Any Atari dealer
should be able to order this for you through CSS/Apex.

[of assemblers]

I have used the Metacomco assembler for a rather large project over the
last year. I have discovered no bugs or 'features' to work around.
I have not given the linker any kind of workout as the 15 or so
individually assembled modules contain *no* entry point or external
references (to maintain position independence).

****

Hello my name is Chris Jeffery and I am an under-graduate at the
University of Newcastle upon Tyne, UK. I hope you can help me:

I own an Atari 1040 ST (Colour and Mono system) which I use for my
university work, entertainment *and* for the development of acade

games to be sold around the world. My first game is due for release around the 4th of July. I would be grateful if you could put me in touch with ST users in the US who would be prepared to send me magazine reviews etc., and maybe swap hints, tips and Ideas?

The game is called Exodus, and is to be release on the Diamond Games label. It was written entirely in M68000 assembler and I would be very interested in 'meeting' other M68k freaks.

Thank you in advance,

Chris Jeffery. (fja1%ncl.turing@uk.ac.newcastle)

N.B. The mail address above is only valid until the 1st of July as at present I don't know where I will be working over the summer vac. If anyone wishes to contact me after that please use my postal address :

Chris Jeffery,
c/o 58 Chestnut Avenue,
Billericay
Essex
CM12 9JG

Subject: Ataris:games, business,education?
To: info-atari16@score.stanford.edu
X-Vms-To: IN%"info-atari16@score.stanford.edu"

I've missed a bit of this discussion group recently, so I hope this is not out of order. I recall a number of comments about how Atari should either fish or cut bait with respect either to being a 'games' computer or a 'serious' computer (for businesses etc.) I don't recall much discussion of the role Atari could and should play in education in universities. And yet it must be the case that many readers of this net group are university users. At Dalhousie we have two Atari 1040 labs, one in the English Dept and one in the Engineering Dept. We thought we could demonstrate the versatility of the machine with this range of uses. And we are happily using the machine in both places. Our standard wordprocessor is WordPerfect; we use Drafix in Engineering, several languages, Publishing Partner and a few other things (like Uniterm, of course). But I wonder where the

other kinds of software are that could be designed especially
for educational use? Is there any work going on for Atari based
CAI packages? Any of the grammar checkers, or writing
assistants, or thinktank packages, or split screen writing
tutorials like the kind you can get for the Mac? Is Atari
seriously encouraging developers into the university education
market? If so I'd be glad to hear of the products that people
are finding useful.

>
>That's what I like about my Plessey terminal (witch is a CIT-101, a
>little glue and a piece of plastic..8-)
>
>Hartmut Semken
>

If I remember right, the CIT has the 'feature' that switching between
80 & 132 columns does not clear the screen. This can be switched off
locally (one of those little bit-toggles in the SETUP mode) or you could
use a proper ANSI 'clear-screen' sequence. Include this in your LOGIN.COM
(assuming you're using a VAX!):

```
$ esc[0,8] == 27
$ cls == "write sys$output """+esc+"[2J"""
```

The escape code (char 27) followed by '[' is called a Control Sequence
Introducer (or CSI for short - 8 bit ANSI has a single-byte version as well,
but most terminals prefer the 7-bit version). '2' is the parameter specifying
the region as 'whole screen' and 'J' is the code for 'clear region'.

>--
> Gerry Wheeler
>

Just to reduce the damper put on that idea, that's exactly what Acorn's
BBC Micro did: there was a system call to read the bits under the current
cursor position & compare them with the character bit-maps held in ROM,
to allow screen editing in modes 0-6.
The BBC Micro was a 6502 8-bit machine running at standard speed (1MHz?):
I'm sure a 68000 can do as well!

Mike.

There is attempt to produce a MIDI standard. The current DRAFT standard
is 0.06, and can be obtained from:

Dave Oppenheim
Opcode Systems
1024 Hamilton Court
Menlo Park, California 94025
(415) 321-8977

I got my copy by just calling.

Some personal comments on the MIDI standard.

I have Master Tracks Pro (Atari ST). This excellent sequencer supports
two formats: Its own, and MIDI std.
Its own format saves EVERYTHING, and can be reloaded without loss of
information.
When MIDI format is reloaded, some niggly details are lost.

MIDI standard is easily implemented, IF YOU ARE A PROGRAMMER.

I have written a converter for Music Studio to MIDI STD, Master tracks (C64)
to MIDI STD, and Music construction set to MIDI STD.
The first two were straight forward; the latter requires interfacing to
SMUS-IFF, the other standard format. SMUS is in note-on-staff notation,
leaving timing to be recreated.

If everyone's got a SMF translater, it's time we got some sequences
posted on the net. It would be interesting to do collaborative
pieces where several people help compose one piece of music by
sending the different parts back and forth. If I was to post
a SMF sequence, what format would be appropriate? Binhex could be
used but I don't know how many non-mac computers use that format.

>Fortran or Pascal??
The problem of the ST is his graphic-mode where also all text
will be put out. To get a charackter from the screen, you first have
to calculate the Postion in the graphic-screen, then compare the
current 8 * 16 (or 8 * 8) field with the current systemfont. You see,
it is a lot of work, so the (nearly) only possible language is assembler.

As I know, gemdos doesn't support such a function, but perhaps
later it will do it :-).

Subject: More mega policy from k. hedger
To: info-atari16@score.stanford.edu

I have just read the response to my posting regarding Atari's
mega-st marketing policies.

1) As for my using expletives on the network, I apologize publicly
for my language in my original posting.
2) The 'Guys at Atari' say that this policy doesn't apply to music
stores.....interesting, both of the places I talked to were music
stores. The first is a full line music store that has been selling
ST's for at least 6 months now. As soon as the MEGA'S were available,
they had them. These are the guys that told me ' uuuummmm we're
re-evaluating whether we're going to carry Atari computers anymore'
Isn't it a coincidence that this statements comes one day after
the other dealer I talked to tells me he received the letter from
Atari outlining the new policy.
3) The 'Guys from Atari' suggest that I check my facts more carefully
before posting to the net. Just exactly who am I supposed to check
with if not the 2 dealers in town that I know of ????

I can assure you that my original posting was based on information I
received from local Atari dealers as stated. If your policy is what
you say it is, then I can assure you that you have some confused dealers

in Boston , Mass.

Say, good point. Of course, no matter how bad certain corporate entities
might be in this regard, it should not really justify rude or thoughtless
criticism. On the other hand, they have had some pretty (dare I say it?)
st*pid (they probably can't sue me for that) policies in the past, and its
looking as though things may be getting worse, not better.

Well, now that I've had my two cents worth, I think I'll just stay out
of this discussion, at least until Atari *REALLY* confirms (or hopefully,
denies) this rumour (about the laser printers).

-> make 16-point ones...)

you can actually replace the system fonts with your own without too much
difficulty. the pointers to the fonts can be accessed via line-A and you
can easily switch these pointers on the fly, perhaps even controlled by
your own control sequence (maybe like nroff "." commands if you like).
the bios/gemdos char output routines (i think) look for the default system
font and just draw the current char. that's how you can make your ST kinda
look like a mac (with "Chicago" font...).

Subject: 8th-Bit Prefixing Bug in UniTerm Kermit
To: info-atari16@score.stanford.edu

I have encountered a bug in UniTerm's Kermit File Transfer Protocol.

I thought other users of UniTerm might like to know about this Bug, so
below is a copy of the e-mail I sent to Simon Poole on the problem
I encountered.

==========
I am currently using UniTerm 2.0c 008

The UniTerm Kermit has the following bug in its 8th-Bit Prefixing
Algorithm when it is Receiving...

Other Kermit UniTerm Kermit

Mode: Sending Receiving
"S" Packet QBIN field: "&" (Prefix) "Y" (I can Prefix)

Thus the two Kermits have agreed to do 8th-Bit Prefixing.
During the transfer (about 11K Binary) the following occures...

Data in file: 26 B0 (Hex Bytes)

Other Kermit Sent: #&&0 (Ascii in "D" Packet)

UniTerm Kermit Wrote: 66 26 30 (Hex Bytes)

Somehow the UniTerm Kermit is converting (what should be) 2 Bytes
of data into 3 Bytes (also UniTerm Kermit failed to set ANY 8th-Bits
anywhere in the file it wrote!). It looks to me like UniTerm Kermit
does not recognize that it has agreed to do 8th-Bit Prefixing, and has
1) controlified the first "&" even though it isn't a "control character",
2) then saved the "&0" directly without decoding the Prefix.

The UniTerm Kermit does correctly perform 8th-Bit Prefixing
when it is Sending...

UniTerm Kermit Other Kermit

Mode: Sending Receiving
"S" Packet QBIN field: "Y" (I can Prefix) "&" (Prefix)

Thus the two Kermits have again agreed to do 8th-Bit Prefixing.
During the transfer (about 11K Binary) the following occures...

Data in file: 26 B0 (Hex Bytes)

UniTerm Kermit Sent: #&&0 (Ascii in "D" Packet)

Other Kermit Wrote: 26 B0 (Hex Bytes)

I have verified this Bug both in UniTerm 2.0c 008 and in an old
UniTerm 2.0a that I still have available.

If it would be any help in debugging this problem, write me and
I will send you a UUENCODED copy of the about 11K Binary file I
tested it with.

Subject: The archive at lakesys
To: info-atari16@score.stanford.edu

Hi,
Can anyone tell me what has happened to the archive of gulam
1.03 at the lakesys archive. I sent a request for it and several other bits and
pieces most of which came back ok (much to my surprise and delight !), however

All the gulam requests were greeted with a message along the lines of ...

File not found in archive ....

I was requesting gulam103/part.uaa etc but this was on an old index
list so I guess the name may have changed. Has it , or has it been removed
from the archive ? I'm currently using a copy of Gulam I got from a PD library
(STUK) which declares itself to be Version 0.5 alpha site test, so I assumed
I was a bit out of date - is this the case or am I using the most current one
after all ? (it certainly seems relatively bug free, but maybe I'm missing
some exciting new commands!)
Alternatively, if anyone could mail me the up to date version I'd
be most grateful.

Thanks in advance for any help,

Paul.

X-VMS-To: @infoatari

About three months ago I inquired about the possibilities of using my American
1040ST in Europe on 50 Hz. I received a lot of replies (thanks!) and, while
most were encouraging, no one actually said, "Yeah, I've seen it work." One
fellow from Atari said basically "It'll work; but to be sure, why don't you just
buy some new power supplies," which wasn't the most reassuring thing to hear.

In any case, when the machine finally turned up after being lost in the mail,
I plugged it into a mongo 220-to-110 V converter and, as everyone expected, it
works fine, monochrome monitor and external 2S disk drive included. Beware
that I received warnings that the color monitor does NOT work from 50 Hz.

If you plan on doing the same thing, you ought to think about getting a trans-
former in the US. I was told they exist over here, but (in Holland) I could
only find little 25 watt ones. I thought I was going to have to break out the
soldering iron and start attaching cables, connectors, and transformers, until
someone found the exact item in a storeroom at work.

This brought to mind a problem I have. Several of the last posting have
required a unix shell to decode. I have only limited access to to a unix
machine which doesn't seem able to unpack these anyway. Is there a program
that allows unpacking these on my ST? Is there a real need to use these
rather than just arcing and uuencoding?

>1.03 at the lakesys archive.
...
> I was requesting gulam103/part.uaa etc but this was on an old index
> list so I guess the name may have changed.

You're right, it's under a newer name, as we have a newer version.
Here's an extract from the latest index:

gu10304/part.uaa 880609 Gulam shell, docs and example .g files
gu10304/part.uab 880609 Gulam shell, docs and example .g files
gu10304/part.uac 880609 Gulam shell, docs and example .g files
gu10304/part.uad 880609 Gulam shell, docs and example .g files

In most cases (if your request syntax is correct), if the file is not
found, then the name has been changed to reflect an update. Just request an
index again. The indexes are updated about monthly, more often if necessary.
It is our intention at lakesys to try to keep the most up-to-date versions of

the programs we have that are available. Some authors send us there work directly, other stuff we get from various sources. This will often result in frequent changes in the index. We are sorry if this causes any inconvience, but feel that it is worth it to get the "latest and the greatest" :-).

You said it loud and clear! When was the last time Atari Corp. ever called any of us before spewing out TOTALLY FALSE statements? And even worse than a "public forum": how about "offical" releases to the press and news conferences?! I remember plainly, as late as 1987 Atari spokesmen were making statements to the press such as "There is no multitasking available for the ST"... almost a year after the release of Micro RTX and MT C-Shell.

Oh, and today I got a call from Sig Hartmann at Atari, <fill in today's title here> telling me that I'm "no longer allowed to make negative statements on USENET" and that he "is my sole contact for Atari related communications". Hmm... sounds pretty heavy to me. If anything happens to me, remember you're all witnesses!

It would be different if I was giving out proprietary information - but we're talking about non-technical opinions. This is America Jack!

Use macget -d
1.) on the unix/vms end to accept the data fork, in a MacTerminal 1.1 protocol
transmission from the Mac to the host. (this protocol is supported by
MacTerminal and VersaTerm.) This puts an exact copy of the Mac MIDI file
data on the host, without any mac file system specific header info.
2.) use uuencode on the host end to make the file safe for mail/usenet

To recieve:
1.) use uudecode to turn the mail back into a binary data file. Watch out:
the encoded form has a filename built in, and if you name your saved mail
file the same as that name, your saved mail will get destroyed, but you'll
get no data file.
2.) use macput -d to move the file to the macintosh
3.) use ResEdit, disktop, or any other such tool to change the files type
to MIDI (4 characters, must be Capital letters.)

>wanted.

Long offsets from a base address? What 68000 instruction do you have in
mind?? Probably you mean absolute addresses (with relocation that is).

Lets see how we can address memory on the MC68000:

1) (An) contents of the location pointed at by An (n = 0-7)
2) -(An) same as 1) but with predecrement of An
3) (An)+ same as 1) but with postincrement of An
4) w(An) word displacement from An; w is a 16 bit signed offset.
5) b(An,Rx) byte displacement with index; b being a 8 bit signed offset.
6) There are also the PC-relative adressing modes; basically like 4) and 5)
7) Absolute short (16 bit signed)
8) Absolute long (32 bit; of course limited by a 24 bit databus).

Your local variables are typically adressed by a(A6), with a being a
negative value for local variables, and a positive one for parameters.
Static and global data? 1), 2) and 3) kommt nicht in frage, as it
would require loading the address register for each different variable.
4) is widely used by various compilers, but means that only 64K can be
addressed (GEMDOS initializes some address registers to point to the
start of the initialized and uninitialized data spaces; these addresses
can be found on the processes' basepage). 5) seems hardly likely, have
to waste two registers.
Leaves us with 7): only for programs in low memory (or I/O
references); not useful for most cases (unless you can enforce this on
your program). And 8): Absolute long. Note that the address generated
will be a long address relative to the start of the text segment; this
becomes relocated when the program gets loaded (GEMDOS does that for
you). This is the default that Lattice C uses (but you can have type 4)
addressing by a compiler option).

Speaking of addressing modes, I would prefer type 4) if the data fits
into 64K; the instruction is shorter and also faster than absolute
addressing. If the data is over 64K you'll probably have to use absolute
addressing (or else you could use something like LEA (An,Dx),Am and then
use Am; but this requires an additional overhead). There's also another
case in which absolute addressing is almost mandatory: when you make an
interrupt routine. When the program that sets up the interrupt vector
exits (memory resident), the data base register will be destroyed. In
this case I prefer absolute addresses.

> Hope this helped. I was taught to not use global variables much but
>it seems that they have their place.

You can often use static variables instead of global ones; they
have a more restricted scope and will be put in the same program
segment(s). As for not using global variables, this is a tendency that
has come forth from the structured programming gurus; I think that you
may use it as a general rule. However, there are very often
values/variables in your program that have a program-wide or

module-wide scope; it would be both foolish and inefficient to not use
that fact.

4430. XMODEM Source in Pascal

Newsgroup: comp.sys.atari.st
Date: 1988-06-29 11:52:11 UTC
From: mike@ncrcpx.UUCP
Message-ID: <1821735@ncrcpx.UUCP>
Source record: 251830

Calling Simon Poole ---

About a month ago I mailed you a memo asking if you would be willing to sell your Pascal sources for XMODEM for a project that we are looking into here. So far I have not heard a reply. Did you get my original email? Would you consider this idea and under what conditions ?

Thanks

Mike

4431. Error in STDCAT

Newsgroup: comp.sys.atari.st
Date: 1988-06-29 13:54:59 UTC
From: klute%trillian.irb@unido.uucp
Message-ID: <409@laura.UUCP>
Source record: 251831

Recently a floppy disk cataloging system, STDCAT, was posted to comp.binaries.atari.st. It claims to be able to catalog floppies with a folder level up to 16. However, I failed in cataloging one of my floppies which has only 3 (three) folder levels. This disk has, however, *many*, *many* folders on the 2nd level (I haven't counted them 'cause I can't count so far :-)).

I tried to reach the author by e-mail but failed so I post it here asking for a correction.

Thanks in advance

Rainer Klute

P.S.: Another nice enhancement would be the possibility of giving a comment to every single folder and file.

4432. Memory Access in Modula 2

Newsgroup: comp.sys.atari.st
Date: 1988-06-29 15:07:23 UTC
From: terrell@druhi.ATT.COM
Message-ID: <3188@druhi.ATT.COM>
Source record: 251832

Reading and writing from/to an absolute memory address in Modula 2:

I know of a "dirty trick" to accomplish this in Pascal, which will probably work with Modula 2 as well. It's based on the fact that variant records allow Pascal's normally strong typing to be circumvented.

Declare a variant record with a long (4 byte) integer field and a pointer to a character field in the variant part). Recall that fields in the variant part are placed in the same region of memory.

Then to peek from memory, set the long integer field to the desired address, and get the desired value by dereferencing the pointer field.

Similarly, to poke a value into memory, set the long integer field to the desired address, and assign the value that you want to poke to the dereferenced pointer.

For example:

```
program peek_poke(input, output);

type
mem_rec = record

case tag : boolean of

true: (addr : integer);
false: (ptr : ^char);

end;

var
dirtytrick : mem_rec;
value : char;

begin

(* Poke value 128 into address 12345. *)
dirtytrick.addr := 12345;
dirtytrick.ptr^ := 128;

(* Fetch the value from address 12345. *)
dirtytrick.addr := 12345;
value := dirtytrick.ptr^;

end.
```

Note that the addr field of the variant record must be a 4 byte integer.

Of course, code written with this trick will tend to be non-portable, so if you can dig up a library routine that accomplishes this, that would be preferable.

Hihi, the ST's 68000 partitions memory as one, 16MByte chunk.
The GLUE-chip partitions memory as follows: 4 Meg RAM, 11 Meg <nothing> (Bus Error/two bombs), 1 Meg of "stuff" (ROM, i/o).

Are you mixing up 8088's segmented adressing sheme ant the ST?

>Whatever happened to Minix for the ST? Does it exist? Is it still being
>ported? Has it been abandoned?

To the contrary! It is finished and has been sent to Prentice-Hall for
reproduction. I will make an announcement when we get closer to the
time that it will be available. I don't want to say too much too far in
advance because people will then call P-H and the people who answer the
phones don't know anything about it yet and the caller says P-H is all
screwed up etc etc. If all goes on schedule, it should be available
sometime in September. Again, I will announce it well in advance, when we
get a shipping date that is solid.

4436. Z80 cross assembler information request

Newsgroup: comp.sys.atari.st
Date: 1988-06-29 22:04:59 UTC
From: zzkj@gos.ukc.ac.uk
Message-ID: <1536@gos.ukc.ac.uk>
Source record: 251835

I am looking for a Z80 cross assembler for the ST. Ideally it should be compatible with the ZASM assembler, but I'm not too fussy. Local labels are necessary, but I would consider an assembler without them if that was all there was. I don't mind if it is a commercial package (as opposed to PD) as I need it for commercial program development. (Please note that I'm in the UK so any UK sources for the assembler would be ideal)
Thanks in advance,

Message-ID: <2073@alliant.Alliant.COM>
Source record: 251836

```
----
regarding large arrays, are we talking about local arrays (defined inside a
function) or globals? i know that even the first st version of alcyon
(for example) has no problems with a global like

unsigned int array[100000];

though local arrays of this size are probably not possible (have never even
needed to try it out).

an obvious solution to this whole problem is to Malloc (not malloc) the space
and then refer to the pointer. this works with 1 dimensional arrays but
multidimensional arrays would be tricky.

-bill

4439. UWSERVER -> Help!!!!

Newsgroup: comp.sys.atari.st
Date: 1988-06-30 04:58:23 UTC
From: humtech@ucschu
Message-ID: <3974@saturn.ucsc.edu>
Source record: 251838

Help!!!! I just got the UNIX end to the UNIX Windows program from the archives at lakesys. I uudecoded (using Dumas' uudecode) and de-arced using arc 5.21. There seemed to be no trouble. But when I transferred all the files back to UNIX to try to get the server running, I discovered that there were no directions as to what to do (no README file or anything). So I just started poking around in hopes that I'd find something that would work. I have a 4.2BSD system so I moved the "makefile_4.2" to "Makefile" and tried a "make" command. First I get an error that says that "../DEFINES" does not exist, and next I'm told that "uw_clk.h" does not exist. After poking around and manipulating the order that the makefile compiles the files, I discovered that several other header files seemed to be missing. I'm guessing that the "../DEFINES" is supposed to be a file containing compiler flags? It seems to me that either I'm missing too many files, or I have to reconstruct a lot of the server from just looking at the other files. Am I really missing some files? I got uwserver.uaa and uwserver.uab from lakesys.

What am I doing wrong?????????

Any help is GREATLY appreciated (I've been looking for the UNIX end to UW for a long time, and now that I get it, I can't get it to work).

Thanx

Mark Frost (humtech@ucschu.ucsc.edu)

4440. Re: Ethernet

>driver for it on the ST...

My understanding is that this board uses more SCSI than the Atari
AHDI interface supports. Atari implements enough to allow Level 0 SCSI
and the ethernet board requires more intelligent SCSI, I think.

Anyway I don't think it's possible to use these ethernet<->SCSI boards
without hacking the AHDI hardware or at the very least buidling your
own SCSI adapter and designing a new protocol. Of course I could be
wrong.

Someone who might know more is Chris at BMS (bms@bdt).

Having both monitors,that didn't bother me. But,here's another warning about the program:it only works for ~15 min or so before saying something like "demo time up!! buy the program". But isn't that the idea of a demo? Would be nice if it would have said "only 15 minutes-hurry up".
(sigh) Oh well.

Overall,I'd say it's one of the better programs out so far if graphics are your bag. At least it's one of the better demos I've seen. I wish more companies would do this so we (the users who actually buy the programs) could "try it out".

4442. my ideal cache program

Newsgroup: comp.sys.atari.st
Date: 1988-06-30 08:04:11 UTC
From: meulenbr@cstw01.UUCP
Message-ID: <157@cstw01.UUCP>
Source record: 251841

After seeing a number of cache programs, I decided to scribble down what
I wanted to see in an ideal cache program.

I am posting this for two reasons:
1) to get feedback about missing items, problems to be expected etc.
2) because I have little time to start the actual implementation, someone
else might give it a try. (Hint, hint). If you want to, drop me a note
saying so, in order to avoid duplication of effort.
Don't expect an implementation from me soon.

How my ideal cache looks:
- startable from auto folder or accessory which installs itself silently
- settings (like size) taken from program name or data file
- resizable when in operation
- selectable which devices are cached
(it is not too useful to cache a ram disk)
- works both with floppies and hard disks
- selectable whether or not write-through
- if not write-through:
- has an auto "sync" facility, which will flush all written buffers
- interval of above facility is user definable
- has a command to flush explicitly
- detect media change and warn (insist?!) that the previous floppy is
re-inserted when unwritten buffers exist.
- intelligent replacement algorithm (something like Least Recently Used)
- (optionally) read ahead (cache the complete track when a sector is
requested)
- perhaps (optionally) always cache FAT and root dir.

I think this can lead to a safe write-delayed cache.
Since a number of things can be modified during operation, the cache will
most likely be implemented as an accessory.

>
>Does anybody know a GULAM adaption for the german ST keyboard?

I don't have a German one but I do have one for a British keyboard (that we in Holland also have. Ther is a table in gulam that contains ASCII codes indexed by keyboard scan codes. You must patch a few of the entries (with a binary file editor). I have the differences here for gulam version 1.03.05. Other versions have it on different addresses. The < entries are the original, the > entries the new version (both in ASCII, if possible) and octal. All addresses are octal.

4444. atari dealers in chicago

Newsgroup: comp.sys.atari.st
Date: 1988-06-30 13:45:00 UTC
From: UUCJEFF@ECNCDC.BITNET
Message-ID: <8807011945.AA03142@ucbvax.Berkeley.EDU>
Source record: 251844

A reader asked about Atari dealers in Chicago, and I tried to email him directly, but our mailer could not decode or otherwise access his address.

Therefore, I will post here. There is one in St. Charles called Computer Celler, it is way out west though, and can be reached at 584-4048. I bought a mega from them, and they have been very supportive about fixing the media change problem. (they replaced the Chinon with another manufacturer)

If you want to stay in the city, I know Guitar Shack on Clark 1 block south of Belmont is an Atari dealer, and they sell Megas. You cant miss it, it is right near those Yuppie clothing stores.

This posting is not intended to be an ad for those store, I am posting this in response to a reader's inquiry.

Jeff Beer, UUCJEFF@ECNCDC.BITNET

> finance, for example. [various things about scanners, etc.]

IMHO there seem to be several things precluding the everyday use of home computers.

One, as you said Neil, is the difficulty of transferring data from real life into bits. And, as an associated factor, nobody is going to do on the computer what they didn't do on paper. People can't expect a computer to magically organise their lives.

Another factor, I think, is the size of the computer. Few people are willing to give up two square feet of their dining room table just so they can read the newspaper electronically instead of the usual way. Ditto for the kitchen counter. I think ultimately we'll need to have thin screens that mount on the wall. Sci fi movies have been doing that for ages.

Of course, it's hard to hang the computer on the wall too, so the wall unit will likely be just a terminal connected to the computer in the basement. If that same computer is going to support all the other terminals in the house, it'll have to be multitasking, right?

So, who wants to be the first to put all this into practice? And what happened to Alan Kay's Dynabook?

4447. small, usable kermit wanted

Newsgroup: comp.sys.atari.st
Date: 1988-06-30 15:30:42 UTC
From: egisin@watmath.waterloo.edu
Message-ID: <19687@watmath.waterloo.edu>
Source record: 251847

I have version 3.0(4) of kermit on my ST,
and it has to be the most brain-damaged version around.
It problems include:
- cannot be interrupted.
- cannot send binary over a 7-bit path.
- if you don't do the local "kermit s" immediately after the remote "kermit r",
it sends every packet twice (or more). The file arrives ok, but
this slows down kermit to even less than the regular, pathetic 70 B/s.

Does anyone have a better kermit that is less than 40K (it has to be small)?

> on. Dan seemed to have blamed me personally for some financial woes
> connected with the takeover of Atari. He lost quite a bit of money because
> the contract with Synapse for Synfile (which Dan co-wrote) was dropped.
I wasn't planning on starting the conversation about SynFile,
but since you have:
Atari did drop the contract. After accepting delivery on
11,000+ pieces which they sold. There was a two and a half year delay
before Atari paid for the 11,000+ pieces of SynFile+. There were also
similar numbers of SynCalc and SynTrend involved plus monies for R&D
work Synapse was doing. Synapse sued for the $4 million owed plus about
to $50 million in damages. Atari settled out of court 2 and a half years
later, just prior to going public.

> Now I think it's a shame that Dan ran into this kind of problem. But he
> knew darn well that I had nothing to do with it (the problem occurred before
> I even joined Atari), but he was using me as a convenient scapegoat. So I
> asked the sysops to get a handle on the namecalling. That's a sysop's job.
Our discussion on the services had nothing to do with Atari's
actions with SynFile. It was in reference to statements you were
making on Delphi about Atari and Atari products. Many of those messages
are still online (they store messages for a very long time) so if people
are interested they can read them there.
The statement that got Neil mad and caused him to ask the Sysops
to intervine was me saying that one of his statements was untrue. He
asked the Sysops to censor me and/or have me removed from the system or
he would leave. They took no action other than forwarding me a copy of
his email to them.

> Once Dan and I met personally, I think he calmed down a bit and realized
> that I was not some ogre out to get him.

>
> Maybe we ought to get together again so he won't forget.
I never thought Neil was an "ogre out to get me", I think he is
a person who is willing to take a job that I and many others wouldn't be
willing to do. Not many people would be willing to act as a front for
Atari or the people who run it. I dislike "Neil Harris, Atari spokesperson",
"Neil Harris, private citizen" is a fairly nice person.

> Most of the professional online systems won't put up with that sort of
> thing. It's a free country, thank goodness -- but paying users of an online
> system tend to object to that kind of stuff.
The only objections to my statements were from you. None of the
users had any complaints.

This is all ancient history, the only reason I mentioned the
event was to point out that David Beckemeyer was not the only person Atari
had attempted to censor. I hope Atari starts listening to their users
and developers complaints instead of just listening to the compliments.
Asking (or telling) developers to quit complaining isn't going to make
things any better. If they continue the way they are the ST, and it's
promise of "Power without the price" will disappear.

> peek or actually Long Peek. He has been trying to use the
> TakeALong command in Modula, but so far, two weeks, no luck.

In general, to peek at a location in Modula-2, you would use something
like:

FROM System IMPORT BYTE, WORD, LONG;

SysTimer : LONG @ 4ABH;

...

WhatEver := SysTimer;

The "@" notation tells the compiler the absolute address of this
variable is fixed in memory. You can't do this for the system timer
on the ST, however, because the system timer is in "protected" memory.
To access this protected memory, the CPU has to be in supervisor mode.
You can do this with the SuperExec procedure in module XBIOS. This is
an example:

FROM XBIOS IMPORT SuperExec;
FROM System IMPORT LONG;

PROCEDURE GetSysTimer : LONG;

VAR
TheTimer : LONG;

PROCEDURE GetIt;
VAR
SysTimer : LONG @ 4ABH;
BEGIN
TheTimer := SysTimer;
END.

BEGIN
SuperExec(GetIt);
RETURN TheTimer;
END.

This is probably not entirely correct; it has been a while since I
worked in Modula-2. It should be enough to give you an idea of what
```

you have to do, however. Good Luck!

Sounds pretty odd to me; the Unix uw program set that I have consists of only 4 files - two source, 1 header, and 1 doc. Compile the two source files with "cc -o outfile srcfile" - no makefile, no extra directories of stuff, etc. (uw.c, uwtool.c, uw.h, uw.1) Works just fine. Send mail if you want to see it.

>junk' crowd. I personally avoid UN*X, since it's in the serious dark
>ages compared to VMS. And going from GEM/TOS -> MINIX/X11 isn't going to
>help performance much...

VMS has a different name then RSX or RT11 or whatever, but that does not
make it state-of-the-art. Lets face it, VMS has it's roots in OSs that
predate UNIX.

When I worked on a VMS system, there was a C compiler, guess what? it
supported UNIX lib calls.

In my oppinion, if you need to run a meat packing plant or a bank, get a
VMS system. If you want to develop software, get a UNIX system. UNIX
was never intended for many of the applications it has been streched to
perform, but yet it survives because it has evolved considerably.

Can we talk about STs now.

>(a constant calculated at compile time) to the base address. On the
>68000, the obvious, compact, efficient method is to use the indexed
>addressing mode, but that limits you to an offset of +-32K.

Maybe it is good to mention that exactly the same goes for actual parameters and automatic variables; most compilers use a frame pointer register (link register , typically A6) to index from. The link instruction itself also takes a offset of +-32K. So if you can avoid it, don't put big arrays or other variables on the stack (there's an other danger with huge stacks: it can run into your heap).

Leo.

>Ahem. You sure this isn't either illegal or going to cost you an
>obnoxious amount of Swiss taxes?

No! It's neither illegal (why should it?) nor does it cost a lot. The Swiss taxes are 6.2%; buying it in the States and adding the Swiss taxes is still much cheaper than the Swiss prices. The Adaptec controller, for example, costs in Germany DM 400.- (it would be about the same in Switzerland if you could get it here) which is about US$ 240.-. In the States it costs only half of it (or even less). Adding the taxes doesn't make a big difference. The only problem about the whole affair is, that warranty and service becomes complicated if you have to send it back to the States... You have to choose between the risk and the warranty service. In this case I chose the risk (which isn't too high, I'd say).

>>Disclaimer: I'm a student at the Swiss Federal Polytechnical Highschool
>>[...]
>To avoid confusion for the poor monolinguals among us, you might want
>to consider translating ``Hochschule'' with ``university'' rather than
>``high school'', as the latter is the name applied to the upper
>*secondary* education in the US. This causes all kinds of confusion,
>usually to your disadvantage.

Thanx for the reminder. I know the difference between 'highschool' and 'university'. I just did't think of it when writing the signature-file. Meanwhile I got the correct English translation for 'ETH': 'Swiss Federal Institute of Technology'.

Tomas

From: mcvax!ukc!strath-cs!glasgow!whitbye@uunet.uu.net (whitbye)
Subject: Nethack
To: info-atari16@score.stanford.edu

Does anyone out there know where I can get hold of the source for Nethack
on the st? If so then please get in touch with me.

Date: 23 Jun 88 11:57:16 GMT
From: mcvax!unido!pbinfo!corona!michael@uunet.uu.net (Michael Schmidt)
Subject: Jove anybody?
To: info-atari16@score.stanford.edu

Is there anybody, who has ported Jove-4.9 to the Atari ST? If so,
I would appreciate a copy very much. Or does even a GNUEmacs port
exist (:-) ??

Or is this the wrong question at all. Is there a superior editor,
one should use on the ST?

Thanks
Michael Schmidt

For those who are wondering, here's the latest index from netlib@lakesys:

---
lakesys netlib index - archives.atari - Atari ST files

NOTE: All files are ARCed and then uuencoded with Dumas' implementaion of
uuencode, 'uue'. It is compatable with 'uudecode', and it makes decoding
multiple part uue files very simple. The ST binaries and a DOC file are
in uuxbin.uaa.

==========

archives.atari would like to express our thanks to
Steven Goodman, Owner and System Administrator of lakesys!

==========

To request files send a message to netlib@lakesys.UUCP consisting of:

send filename/part.uaa from archives.atari
send filename/part.uab from archives.atari
send filename/part.uac from archives.atari
etc.

If the file is found in one of the new volumes, (the example is volume 1) the
syntax is:

send volume1/filename/part.uaa from archives.atari
send volume1/filename/part.uab from archives.atari
send volume1/filename/part.uac from archives.atari
etc.

Note there is no space between the word "volume" and the number of the volume.

Subject for the message is not necessary.

Use the form above to assure that the parts will arrive as separate messages.
Parts are approximately 50k each.

This index can be obtained by sending:

send index from archives.atari

to netlib@lakesys.UUCP

A path which has proven to be successful for some users is:

lakesys!netlib@csd1.milw.wisc.edu

Any comments, problems or suggestions, please mail to martin@lakesys.UUCP.

To: info-atari16@score.stanford.edu

For whatever it's worth I have an old 520 expanded to one meg, and a mega 4
at home and another mega 4 at work. All three have been more reliable than the
Mac's and the XT in the office, tho' the one at the office has some mystical
problems with NeoDesk, getting the program icons on the desktop screwed around
while I've never had any problems with the one that is mine. Both about the
same age, mine two months and the office one 4 months earlier.

Just adding some data for those with a statistical bent.

Subject: Re: C compilers on the ST
To: info-atari16@score.stanford.edu

I don't li
I don't like CSD. They have a difficult setup for keys, you need to hit
several to do anything. It also replots the entire screen (fast, but it
still flashes irritatingly) each time you do anything. On my PC, and even

under PC Ditto, I have used Power C's C-Trace. For some silly reason, they chose things like insert to set breakpoints and watchpoints, spacebar to single step, and return to exectute in trace mode instead of some obscure set of function keys. And it highlights successive lines until it actually goes off screen and can handle graphics.
I also can't see the assembly instructions, so I had to also use db separately to trace a problem - I can't see the low level in CSD. It also crashed (db too!) when I ran a problem program. I don't think they did a bad technical job with CSD - just a bad ergonomic job. I hope they fix it, because otherwise it is a good debugger. The ST's function keys just aren't the best to overload with functions, and I need both db and csd's functions in one debugger.\

From: sco!kurth@uunet.uu.net (Kurt Hutchison)
Subject: Midi File Format Standard Found
To: info-atari16@score.stanford.edu

I received several responses to my request for the midi file format standard. I have successfully called Opcode (see below) and been promised a draft in the mail. I didn't talk to Dave Oppenheim, the secretary was able to send me a copy.

I didn't call the MIDI association but I am posting the address FYI.

When I get the draft I might post a copy to the usenet if anybody is interested and it is not too much typing. I still have a copy of the MIDI 1.0 message standard that was posted a little while back if anybody wants that.

One last thing, now that I have (hopefully) gotten my hands on the file spec, does anybody out there have any recommendations for score editors that are compatible with the standard?
I already have a sequencer and I am hoping to save a little money by buying just a score editor.

Master tracks Pro has been mentioned as a sequencer that accepts standard midi file format files.

- kurt

From the recommendations I received:

There is attempt to produce a MIDI (file format) standard.
The current DRAFT standard is 0.06, and can be obtained from:

Dave Oppenheim

ATARI 520ST for sale with the following equipment:

(1) SM1224 Color Monitor (Original, Ultra-Crisp Monitor)
(1) Atari ST Mouse
(1) Double-Sided Disk Drive
(1) 520ST Keyboard Computer

And a whole lot of Public Domain Software (50) Disks

$700.00 or best offer - no reasonable offer will be refused

4461. Re: Modula2 and Peeking

Newsgroup: comp.sys.atari.st
Date: 1988-07-01 16:17:04 UTC
From: browndf@cs.glasgow.ac.uk
Message-ID: <1461@crete.cs.glasgow.ac.uk>
Source record: 251761

The standard way to do memory addressing in Modula2 would be something like this...

```
VAR
p : POINTER TO INTEGER; (* 2-byte signed quantity *)
contents : INTEGER;

BEGIN
p := ADDRESS(address); (* address you wish to peek *)
contents := p^; (* do a peek *)
p^ := contents; (* do a poke *)
END.
```

Obviously to access something which is in the ST's protected areas of memory (like the system timer variable) you would have to use the enter supervisor mode call first. To peek/poke quantities other than integers you would need pointers to other quantities e.g. POINTER TO BYTE, POINTER TO WORD, POINTER TO LONGWORD.

ps BYTE, WORD, LONGWORD and ADDRESS all have to be imported from SYSTEM.

Version 3.0 does handle ARRAYS that are larger than 32k... I've never
had any array ELEMENTS that've exceeded 32k (or any structures by themselves
which were that big) so I can't verify/deny what was said about that. However,
I DO know that MWC 3.0 properly handles large arrays (how large, I'm not sure)

Just for kicks and giggles, why would anyone want elements/structures
that were >32k? Or, put differently, what's in it? Huge arrays? (Or 16384
ints? :)

From: FRANK%aslcl1.sdr.slb.com@RELAY.CS.NET
Subject: HP DeskJet
To: INFO-ATARI16@SCORE.STANFORD.EDU
X-VMS-To: MRGATE::M_SDR::IN%"INFO-ATARI16@score.Stanford.edu"

I just bought a HP DeskJet and thought I'd report my experiences.

1. Reviews in Current Notes and ST Applications (June) are accurate.
2. It works great with TimeWorks DTP LaserJet GDOS driver.
3. It works even better with Migraph DeskJet GDOS driver.
4. For some applications you might want the Epson FX-80 emulator
cartridge. Makes DJ work like Epson but text is 300dpi at
100cps. Its better than Epson cause compressed type is also LQ.
Graphics is only Epson quality thou with Epson cartridge.
5. Epson cartridge works fine with Epstart and Magic Sac.
6. DJ can be used in native mode for text if you use Serial driver
and Typewriter mode that comes with MS Word. Great quality type
but only one font type per document.
7. Not only is DJ FAST but it is whisper quiet. My Supra totally
drowns it out.

It so impressed my local Atari dealer that he will be carrying DeskJets.
He says he will sell them at $800 (List Price is $1000). Call Dave
at Computers to Grow (713) 777-1673 for more info.

The DeskJet is a perfect match for the ST, it works fine with all
ST memory configurations 512K and up. With a 1040, Timeworks DTP and a
DeskJet, you can have a true DeskTop Publishing System for under $2000,
although a hard disk would speed things up.

To me the DeskJet is "power without the price". As long as Atari wants $1995
for their Laser, the DeskJet offers the most price/performance!

I have no affiliation with either Computers to Grow or Hewlett Packard, other
than being a satisfied customer.

Brazil - It's only a state of mind.

Subject: disk drive data disaster, part 2
To: info-atari16@score.stanford.edu

You may or may not recall that I was having problems with frequent
and inexplicable data errors on my SF 314 floppy. I received many
letters, and thanks to all who wrote. The mail I received indicated
that basically _anything_ could be the problem - the disk controller
chip, the head alignment, dirty heads, bad disks... And the answer
is - I have absolutely no idea what. The drive magically fixed itself
the very day I planned to take it into a store for head alignment.
This was over a week ago and it hasn't even hiccuped since. All the
disks that were "unformattable" and "completely damaged" are now
perfect. I have thrown out most of the really troublesome ones. My
advice to those with this problem is the following: pick the drive up,
shout in a loud voice: "I'm going to take my drive to the store now for
alignment. Oops, looks like I won't make it in time." and slam it back
down on the desk with a gentle yet firm touch. It worked for me.

Subject: RE: Atari Hard disk "clones"
To: info-atari16@SCORE.STANFORD.EDU
X-VMS-To: COINS::IN%"info-atari16@score.stanford.edu"

I have built my own hard drive sub-system for my 1040ST (the 520ST
would be the same). This is what I did:

1) I purchased Supra's DMA to SCSI adapter from the store where I
purchased my ST (cost $125.00). Contact your local Atari dealer or Supra
directly for info on how to get this. There are several other companies
that sell DMA to SCSI adapters for the ST.
2) I purchased via mail order an Adaptec 4000 SCSI to ST506 disk
controller from The Computer Surplus Store (715 Sycamore Drive, Milpitas, CA
95035, 408-434-0168 (phone orders: 408-434-1060)). This cost me $89.00.
These people also sell the Adaptex 4070 controller. The 4000 is a straight
dual drive ST506 controller, the 4070 is a RLL controller (also 2 drives I
believe).
3) I purchased from JameCo an IBM-PC/XT clone box & power supply
(JameCo sells all of the pieces to build-your-own IBM-PC XT or AT clone -

the boxes, power supplies, mother boards, etc.) The case went for about $30.00 and the power supply for about $100.00. The box is rather large and the power supply rather beefy - I plan to add a 1/4" cartidge tape drive (I already have a SCSI to QIC-36 tape drive controller). You might do with a smaller box and smaller power supply. Probably any full-height or dual 1/2 height drive box will do (use a single 1/2 height drive and put the interface board where the second 1/2 height drive would go). Priority One sells disk drive boxes, as to various other mail order companies. Check out the back of BYTE magazine and/or The Computer Shopper.
4) Ordered (from various electronics suppliers) ribbon cable (50 conductor) and connectors: 50-pin header connectors (SCSI bus), 34-pin edge connectors (hard disk interface cable), a 20-pin edge and header connecters (hard disk interface cable), and a 2-pin power connector set for the Surpa board.
5) I purchased an ST251 (40+ meg, half height hard disk) from Bull Dog computer. I think I paid about $400 for this drive. It even came with MS-DOS software for formatting and partitioning the drive (not much use to me!).

It all works. The Supra board came with Supra's hard disk utilities disk - had no trouble formatting and partitioning the drive. I have it setup with two partitions: a small (2MEG) GEM partition and a large (38+Meg) OS-9 partition (I mostly run OS-9 rather than GEM).

The Supra DMA adapter came with info on adding your own hard disk controllers and the Utilities disk had an ARC file with picture files showing the board layouts of the Supra board and seveal popular SCSI/ST506 controller boards. It is not really hard. So long as you keep track of pin one on the various connectors, you should not have trouble. Oh, one trick: 1/2 the pins on each of the ribbon cables are grounds - you will notice that the contacts on the PC boards will have all (or most) of the pins or edge fingers wired together - this can be used to verify the that the connectors are correctly oriented. Also: on the power connector set for the Supra board - it is a good idea to wire the female end to the "live" (power supply) end. This prevents fireworks should the power be applied and the connector is just hanging loose - prevents shorting out the power supply to ground.

To: info-atari16@score.stanford.edu

I decided to check out what is happening at Compute! on the Atari
ST today. Apparently all the rumors are correct, and Compute! has
discontinued the Atari ST magazine and disk. A quick call to
their 1-800-727-6937 number confirmed that distribution has stopped.
I have the June/July issue, and they said that the unused portion
of my subscription would be refunded, but they don't know when!
Well, there goes another "Atari" product 'dropping into the ole bit
bucket'! Is someone trying to send US a message? Hello, Atari, is
anybody home?

Subject: Re: MWC & large arrays -- help!
To: info-atari16@score.stanford.edu

This is in response to the question about large structures in MWC (INEWS
is not letting me include the article!)

The only thing I can think of right now is that the problem is with the
ST, and not the MWC. In Lazer C you are restricted to 32K arrays and
structures and since it is because of the way the ST partitions memory,
I'd have to say that MWC would have the same problem...

I could be wrong, so please no flames.

Atari 520ST system for sale:
Atari 520ST computer
2 SF354 (single-sided) drives
Color Monitor

Plus the following store bought (includes boxes and manuals) software
and hardware:

Megamax C Development package
Hippo Sound Digitizer (all hardware included)
Dungeon Master
Sundog
Music Studio
The Bard's Tale
S.D.I.
Brattacus
plus MUCH more
($700+ worth of software)

also approx. 100 disks of PD, Shareware, and other software.

Asking: $700 or best offer.
(Think of it like buying the software and getting the computer
for free! ;-)

If you are interested, another $150 will buy you the Atari SF804 (ST
standard) Dot-Matrix printer and a cabinet to house the entire system.

Please contact me at jac423@leah or by replying to this message.

> *** flame off ***
Do not flame Atari for the unstable Blitter. This is a problem, the
semiconductor company (General Instruments?) has (the Blitter seems to
be too complicated for their machines 8-).
But *flame* *them* for using cheap sockets and circurit boards (and

noisy fans). Flame them for their circurit design (unbuffered outputs of
the soundchip to Centronics).
No, wait!!
Stop flaming them!
They could start making the hardware more stable; this would put me out
of buisiness (I'm fixing "broken" STs...8-)
>Don't get me wrong. I do like my Atari, and intend to do what it takes to get
>a workable system. It is still the best micro on the market for my purposes
Me too. I like it, but some day the fixes will be more expensive than
another ("real") machine.
>Perhaps I am the victim of a wild fluctuation of statistics that occurred in
>the vicinity of Tallahassee and my experience is far from usual. I certainly
>hope so for Atari's sake.
Perhaps You are a victim of temperature. The power supply of the mega
seems to be the same as the one of the SH205.
I got rid of it (and built one myself) and my harddisk problems were
gone!

I've seen references to this a couple of times, but I don't understand what it's about. You can't insert a 3.5" diskette in upside down. (Can you?) Anybody using this? What does it do?

Subject: Wall Street Wizard (the stock market simulation)
To: info-atari16@score.stanford.edu

This is an unabashed advertisement for a new stock market simulation called `WALL STREET WIZARD' available for the ST. This is being privately distributed (for now) so I thought I'd let you know. An abbreviated version of the game has just appeared in the latest issue of STart magazine.

Wall Street Wizard is a stock market misulation that runs on any ST (but you need a colour monitor). The object of Wall Street Wizard is to begin with $10 000 and turn that into a million dollars in a year. Your job is to buy and sell (the way your capitalist friends do). The computer informs you of occasional market flurries and generally does its best to reproduce the market at its wildest. Industry insiders may try to sway your buying decisions but a little discernment is required. You don't have to go it alone -- three stockbrokers (Wildeyed Willy, Cautious Charlie and Nervous Norman) can be consulted with a click and a little cash. The Market index shows you how well each company is performing; well, how it has performed so far -- how it will perform is the question, isn't it?

So far, I'm told (by its creator) that Wall Street Wizard is getting rave reviews from around the world. One stock broker wrote to find out how he could buy stock -- in the game! Well, you can't yet. But you can get the full version of the game, complete with margin trading, company financial reports and three levels of play.

For ordering information, contact Tony Lovell, Lovell Marketing, 699
Eglinton Ave. West, Suite 207, Toronto, Ontario M5N 1C6, Canada.
Or, heck, send your name to me. I'll pass it on to Tony.

It seems to me that you may learn how to invest all that money that
you make at your job a lot more wisely after playing a few rounds
of Wall Street Wizard. And, in the meantime you won't lose your
proverbial ...

I would like to make a request for some information about the
assembler that is included with the MWC package. I use MWC alot and would
like to try some assembly. Is this much like the UNIX assembler. Is there
a macro package like M4 available for it. I have quite a bit of samplers
for a UNIX machine with a MC680X0 chip. It has always helped me to be
able to look directly at samples while trying new stuff. (Yes I realize
all hooks to the O.S. will be vastly different. When all else fails
link in libc.a and use the standard functions.

> in half.
>

I have to agree with this comment. Alcyon worked (with some problems)
so I tried MWC. The first version I fought often with. Version 2 I thought
was a breeze to use. With the release of 3.0 and CSD, all I can say is WOW!!!
I found bugs in the first day I had been looking at for weeks.

I did find one thing I think is a bug though, #line preprocessor
statements confuse it.

As for some of the others, I tried Lattic (Slow as snails) and
anything that requires overlays on a 68000 system can forget it. A lot
of the others I have not tried because either they were not around when I
was looking or there were horror stories about there use.

Subject: Turning off vertical blank interrupts
To: info-atari16@score.stanford.edu

A while ago I asked what would happen if I set the interrupt level of an ST high enough to disable the vertical blank interrupt. The responses were not unanymous, but I got the idea that there should be about a 5% speed increase, against the possibility of crashing GEM. I just tried it in a computation-intensive GEM application. The good news is no crash. The bad news is only maybe a 1% speed-up. By the way: I tested that the vbl interrupt was really disabled by flipping the switch that controls whether my Thomson Ultrascan monitor is claiming to be color or mono: monitor change is detected in the vbl routine.

Probably something wasn't making a good connection and jaring the drive or flexing the cable fixed it. I plugged an external drive in once and it was completely inop. I disconnected the cable and reconnected it and it has worked faithfully for over 1.5 years. I never saw what might have caused this. It's a tough decision to take something apart that is brand new to make sure something isn't just loose that you can fix real easily.

>multidimensional arrays would be tricky.
>
>-bill

Just specify the correct pointer type, for instance if you want an
array of this type:

unsigned int array[200][500];

then your pointer should be declared:

int (*arrp)[500]; /* that's just 1 pointer, for pointing to an int [500];*/

you initiate it as follows:

arrp = (int (*)[500])Malloc(200 * sizeof(*arrp)); /* isn't that nice 8-) */

and now you can say for instance:

arrp[155][430] = 12345;

In fact you can use all normal pointer conversions, such as sizeof, *,
&, [], 'arrp' being a pointer of the same type as 'array'.

Note that the () are obligatory;

int *arrp[500];

are 500 pointers to int, and that's something quite different!

As for big auto arrays, that should be avoided; the most effective
addressing mode for them being a word offset from the frame pointer (so
a restriction of 32K). Of course you can use big static arrays if the
function is not used recursive; these are local too.

Any University salesplans?

There are still some folks interested in buying STs for university use. In the developer notes I've seen mention of limited-time-only student discounts, but no sign of a general policy for selling to universities and other large organizations. I get the impression that Atari execs target certain companies and send marketing people to them to wine and dine the purchasers pretty much on a case-by-case basis.

IBM, HP, Apple, and other big companies have been very aggressive in setting up purchase agreements with the state and university. The obvious advantage to buying through them are the discounts...even single item purchases may save 10-40% over buying from the local dealer. The discounts really reduce the price difference between "big name brands" and the local ST price, leading one to wonder why any large organization should buy Atari. And there are other advantages in some of the agreements:
- firm prices through the fiscal year so purchases can be properly budgeted
- orders through regional distribution centers provide fast service and firm delivery dates. Local dealers can't provide a large inventory of big ticket items.
- special maintenance agreements. The big companies seem to realize that small dealers can't support a full-sized maintenance service, so they allow machine swaps or loans and send units to a central service point to be fixed.
Apple made the biggest splash around here by extending discounts to students. They were clever enough to send some corporate types to the local user groups and work the members in a cheerleading frenzy...the user groups contacted students, faculty, local media, and everyone else in an impressive burst of quasi-religious zeal, and Apple got a statewide PR blitz.

Anyway, the question is: will Atari include government and educational organizations in their marketing plans, and go after them? With all the alternatives readily available Atari can't expect buyers to pay high dealer prices, wait indefinitely for backorders to arrive, and not be able to buy the top-of-the-line products (Megas) simply because the dealer can't afford Atari's expensive maintenance/minimum order requirements.

I'd be interested to know if the people who have bought STs for such organizations haggle with local dealers, talk to Atari directly, or what. In the past, people here were getting fairly decent prices

and delivery times from mail order sellers, but no more. If Atari doesn't have a reasonable alternative, I'll be stuck advising people to buy (yecch) Macs instead. Some of them have already done so...

Is there an application out there to teach touch typing? I guess something that would administer drills and exercises then keep score would be ideal. This is intended for the 13 year old son of my advisor. A public application would of course be best, but inexpensive should also be OK. After all my advisor has a job. :-)

From: stdnet@stag.UUCP
Message-ID: <511@stag.UUCP>
Source record: 251768

From: thelake!steve@stag.UUCP (Steve Yelvington)

I compiled a directory lister with Mark Johnson C, version 2.0.
It works just fine, but at the end of the directory, it prints out a
message on the console: "(no more files)".

This message is nowhere to be found in my program or in the MJC library.
So I figure that either it is coming from GEMdos, or I have a friendly ghost.
I want it to go away.

One of the local programmers (John Osawa, author of the Schizo desk
accessory) tried my code with Mark Williams C and got no such message.
He suggested that MJC's startup code may throw a switch, and mentioned
something about Perror. I thumbed through "Atari ST Application
Programming" (Pollack and Weber), but found no references to Perror.
It's not in osbind.h. I found nothing like it in the MJC startup routines,
either.

So: What is Perror? How do I shut off this message?

Unix has its roots in operating systems that predate Unix*. I hate
VMS and my feelings are: VMS is an operating system too advanced for
the hardware it runs on and by the time there is hardware that is good
enough, it won't be advanced enough. That doesn't say anything about
the philosophy behind it, just the kernel internals. The philosophy
isn't worth mentioning (ever tried to _USE_ a VMS system? Can't.)

4470. Mono shakes

Newsgroup: comp.sys.atari.st
Date: 1988-07-01 19:19:23 UTC
From: Robert_Lisowski@rubbs1.UUCP
Message-ID: <64.22CC8753@rubbs1.UUCP>
Source record: 251770

My mono shakes, even with the color monitor off. I think it might be a bit of instability in one of the oscillators or hold cir's. The characters at the extreme right of the screen are of less width than the rest of 'em, and that can only be because the H osc. is slowing the sweep at the end of each line (or the magnetic field is messed up).

I have noticed that the H position of the active part of the screen is different for each bootup, as if the monitor locks in a different place each time. I don't think the GLUe is offsetting the lines, but I'll have to make sure (doesn't seem possible). This problem happens with both monitors, that's why I wonder.

Rob

...
<delete more comments and small program>

This is good, but there is one additional piece of information needed.
The original poster asked to access location $4ab. One needs to be
in supervisor mode to do that. In TDI Modula-2, one can not pass
parameters to a superexec'ed procedures, they must be global to the
procedure. But, essentially, all that is needed is to peek and poke
while in supervisor mode with a structure essentially as written by terrel.

>Thanks for any and all help.

This was posted to comp.binaries.atari.st a couple weeks ago. I have since
made a couple more changes to it, and will probably be sending the updated
binary file to a couple of the servers. (er... someone care to enlighten
me re: submitting stuff to a bitnet server?)

The two changes were:
scan the argument list for leading '>' characters in a filename,
and treat that as an output redirection, to allow redirection
from the GEM desktop or from any of the various ARC shells.
This code only recognizes '>' and ">>" and handles each correctly.

Allow "*.*" to be equivalent to '*' for wildcard purposes. (The
MWC library's pnmatch routine acts like Unix, and wants '*' to
mean everything, but most people are more familiar with DOS,
which uses "*.*" ... Oh well, I always used it from msh so I
never noticed a problem...)

If there is sufficient interest, I will send the new executable file for
submission to the binaries newsgroup. You'll need to find the original
posting if you want to get the docs.

Has anyone had any dealings with Tech. Specialites in Houston.
If so could you comment on them.

I am considering buying their drive setup (controller, atari adaptor,
cables, brackets, case with space for 2 1/2 height 5 1/4" drives, power supply,
and fan) for $267 and dropping in a new ST-251-1 (42 meg, 28ms) that I
have found for $399. This gives me a total cost (including shipping and
C.O.D. costs) of $694 for a large, fast, and expandable setup.

Thanks,

P.S. I have only got one reply from Circuit Maker users wanting to share
common circuits. Where are all the hardware people?

For the degree in which I need assembly the assembler that comes with the
GST-C compiler (anyone use that??!?) is quite satisfactory. It should be
possible to use macro's and the like with this assembler, but I have the
feeling that this somehow has been disabled (found those assembler
directives doing 'strings' on the program). I suppose because they (GST)
sell the macro assembler also as a separate product (b.t.w. has anyone
managed to 're-enable' macro's or is this not possible?).
As for a macro package, most decent assemblers have their own macro
handling stuff but M4 is a preprocessor, so if you want that
functionality, you could write your own preprocessor to handle stuff
(this is much easier than writing a general preprocessor which must be
aware of C syntax, quoting etc).

If you plan to buy a C compiler to have also an assembler, I wouldn't
recommend GST-C. When I bought it two years ago, it couldn't handle
floats and had only a poor subset of what a decent compiler should have.

4476. Hard Disk auto folder problem

Newsgroup: comp.sys.atari.st
Date: 1988-07-02 15:40:47 UTC
From: wawers@DMZRZU71.BITNET
Message-ID: <8807021540.AA22916@ucbvax.Berkeley.EDU>
Source record: 251777

Hi folks,

Question : How do you prevent the auto folder programs
from beeing executed ?

OR

How do you make your ST execute the floppy disk auto
folder instead of the hard disk auto folder ?

I would be glad, if someone could answer one of these questions.

The specific problem: I have two programs in my hard disk auto folder,
which do not accept each other. After running the
second program 4 bombs do occur and that is it.
The programs do run properly for themselves.

Any attempts to avoid the execution of these
programs (pcommand and idle12) failed.

Theo

Another BIT bites the dust.

WAWERS@DMZRZU71.BITNET

Yes, I found the bug in my Kermit-UCSD. Sorry about the False Alarm.
I had looked through all my code before I reported the "bug" but
had missed the bug in my code. I found it today while putting in
some new code for something entirely unrelated. My "S" packet was
one byte short (i.e. I had not really sent the "&" even though the
debug messages said I had).
>...
>Rest of letter irrelevant ....
>...

Thanks again for responding so quickly to my "Bug Report".
Sorry for the False Alarm. Uniterm is a very good Terminal emulator
and I use it all the time. Unfortunately it is the only implementation
of Kermit I had that supported 8th-Bit Prefixing to test my Kermit-UCSD
against. If I had been able to test it against another Kermit I would
have realized sooner where the bug REALLY was. That little bit of
information on the QBIN field that Uniterm responds with helped.

From: jason@lakesys.UUCP
Message-ID: <791@lakesys.UUCP>
Source record: 251774

I have a Supra HD, and use their software. Under it, you can press Alt-Shift-Control when you turn the computer on to avoid autobooting the HD, allowing you to manipulate what's in the folder (delete or rename one or both of the offending .PRGs). I'm not familiar with other HD software, so if you don't use the Supra software (which I like), I can't help...

>
>you initiate it as follows:
>
> arrp = (int (*)[500])Malloc(200 * sizeof(*arrp)); /* isn't that nice 8-) */

- err, s.b. Malloc((long)200*500*sizeof(int));
As written above it allocates space for 200 pointers, not arrays.

BUT, a better method is to Malloc or malloc or simply statically allocate
an array of 200 pointers, then allocate (in a for() loop) 200 1-D arrays
of 500 ints, and initialize the pointers to the 1-D arrays. Now the
pointers can be used as matrix rows:

>and now you can say for instance:
>
> arrp[155][430] = 12345;
>
>In fact you can use all normal pointer conversions, such as sizeof, *,
>&, [], 'arrp' being a pointer of the same type as 'array'.

Note that for this method you DO write:
>
> int *arrp[200]; /* not 500 */

With this technique you can get around malloc's 64K limit with portable code,
and matrix access is FASTER, too! Also, both dimensions of the matrix
can be decided upon at run time (e.g., can be given by parameters to
a function). In the first method, and in statically allocated arrays,
the dimensions are fixed at compile time, a deficiency of C.

4482. Re: my ideal cache program

Newsgroup: comp.sys.atari.st
Date: 1988-07-03 17:51:48 UTC
From: egisin@watmath.waterloo.edu
Message-ID: <19712@watmath.waterloo.edu>
Source record: 251782

In article <157@cstw01.UUCP>, meulenbr@cstw01.UUCP writes:
< After seeing a number of cache programs, I decided to scribble down what
< I wanted to see in an ideal cache program.
<
< How my ideal cache looks:
< - startable from auto folder or accessory which installs itself silently
< - settings (like size) taken from program name or data file
I don't do this in my cache and other resident programs
because I is so trivial to write a small (<1K) program
that reads a file (AUTO.BAT) containing commands of the form
<command> <arguments>
and Pexec's the commands. Put this program in \AUTO.
This also avoids the problem of order of execution of AUTO programs.

< - resizable when in operation
If I want to implement this by having a configuration program
(CCONFIG.TTP) pass the request to the resident cache program,
how do I get TOS to arrange that the Malloc'd block are associated
with the resident program, not the configuration program?
How do resizable ram disks do this?

< - selectable whether or not write-through
< - if not write-through:
< - has an auto "sync" facility, which will flush all written buffers
< - interval of above facility is user definable
A delayed write-through cache seems like the best idea,
but I don't know how to implement it. A VBL routine could check
whether it was called from user mode and flush dirty sectors then,
but you are rarely in user mode when waiting for input (shell prompt).
Anyone have any other ideas on this?

< - has a command to flush explicitly
< - detect media change and warn (insist?!) that the previous floppy is
< re-inserted when unwritten buffers exist.
< - intelligent replacement algorithm (something like Least Recently Used)
< - (optionally) read ahead (cache the complete track when a sector is
< requested)
< - perhaps (optionally) always cache FAT and root dir.
Making the FAT permanent is unneccessary with any reasonable replacement routine,
the FAT is referenced constantly by TOS.
<
< I think this can lead to a safe write-delayed cache.
< Since a number of things can be modified during operation, the cache will
< most likely be implemented as an accessory.

4483. UNIX versus VMS (Re: Porting utilities to the ST.)

Newsgroup: comp.sys.atari.st

VMS is a serious resource hog. I'll take RSX-11M over VMS any day. It's smaller, faster (LSI-11 with RSX beats Microvax with VMS any day), and RSX actually has a *useful* system monitor.

It'd be pretty easy to port an RSX-like operating system to the ST. RSX supports unmapped memory, too, though you need to write position-independent code.

Some people are "making a mountain out of a molehill". The fact is that the dealer does NOT have to buy a laser printer for EACH Mega, all he has to do is buy A (as in one) laser printer to carry the Mega line, that's all.

That means a vendor he can sell all the mega's he wants with JUST ONE LASER PRINTER in his whole store! True, even the restriction of having to buy one laser printer that a vendor may not want is controversial policy, but it is certainly not what a few people are trying to make out of this.

I can go into town to my local dealers' (not a musician's store) and buy a Mega2 or Mega4 , and sure enough, there is a laser printer there, but I don't have to buy it!

Who cares? Sure, it's nice to fit a ship into a bottle, but if I'm going on a cruise, I'd rather take the QE2 (if I'm trying to get from point A to point B, I'll probably take an airplane).

>faster (LSI-11 with RSX beats Microvax with VMS any day)

Even if true, so what? What do you do when you outgrow your "LSI-11" (I assume you mean the J-11)? Network? Are you going to claim that RSX networking is superior, too? Also, don't forget about the MicroVAX-3000 series.

>
>- err, s.b. Malloc((long)200*500*sizeof(int));
>As written above it allocates space for 200 pointers, not arrays.

That is NOT correct, you should read better first before critisizing someone else's stuff. It would have been, if it said 'sizeof(arrp)'. But no, it says 'sizeof(*arrp)'; and while (*arrp) is an int[500] - the object which arrp points at - it is correct as it stands.

>BUT, a better method is to Malloc or malloc or simply statically allocate
>an array of 200 pointers, then allocate (in a for() loop) 200 1-D arrays
>of 500 ints, and initialize the pointers to the 1-D arrays. Now the
>pointers can be used as matrix rows:

You're changing the subject. The original problem was not to use a different scheme, it said: while you can use Malloc to allocate a large one-dimensional array, it will be difficult for a higher dimension. The tendency of my article was simply that this isn't difficult at all, just use a pointer of the correct type. Yes, I know to how to set up dope vectors, and note that your 'loop' is not so time & space efficient if you allocate the 200 arrays separately. Better allocate it in one chunk (together with a pointer array), then use a for loop to set up the pointers. Furthermore it depends on the situation whether your pointer array is 'better'; might as well use non-constant pointers into the array, this will even prove faster.

>>and now you can say for instance:
>>
>> arrp[155][430] = 12345;

>>
>>In fact you can use all normal pointer conversions, such as sizeof, *,
>>&, [], 'arrp' being a pointer of the same type as 'array'.
>
>Note that for this method you DO write:
>>
>> int *arrp[200]; /* not 500 */

You misquoted me. I never said that. The original said:

then your pointer should be declared:

int (*arrp)[500]; /* that's just 1 pointer, for pointing to an int [500];*/

and a bit further:

Note that the () are obligatory;

int *arrp[500];

are 500 pointers to int, and that's something quite different!

What I meant to say was that you had to use () for the pointer
declaration I used. Furthermore, while I'm declaring a pointer (that
is ONE pointer) to a int [500], the 500 is correct. (and should NOT be
200; it should be 200 in your case).

>With this technique you can get around malloc's 64K limit with portable code,

>the dimensions are fixed at compile time, a deficiency of C.

You make it sound as if my code wasn't portable; it IS (at least on
every decent compiler). As far as speed is involved, I think using an
extra pointer of type int * into the array dynamically is still faster,
and uses less space; what if I had as an example:

char carr[20000][5];

bit of a waste doing this with pointer arrays, don't you think?
As far as the dimensions is conceirned I agree; but this again was not
the original problem. Besides, if you want both dimensions free, you
have to allocate the pointer array dynamically too. And then all your
pointer efficiency is gone (using double indirections).

4489. Re: Hard Disk auto folder problem

Newsgroup: comp.sys.atari.st
Date: 1988-07-04 08:05:03 UTC
From: alfred@dutesta.UUCP
Message-ID: <1168@dutesta.UUCP>
Source record: 251789

Problems with conficting programs,accessories on your hard disk Theo:

Last weekend I got the same problem with a accessory. To remove this, or
rename it, press <alt><ctrl> during bootup (if you are using atari hdboot
prog). Now the computer will boot from floppy a, here you have a floppy which
contains `ahdi.prg` (NOT in the autofolder if possible), start it up (by hand)
wait until the desktop returns, then create a disk C icon, open it and do
whatever you want -> removing, renaming conflicting progs.
If a program in the autofolder doesn`t have `.prg` as extension it won`t
be executed.
I hope this answers your problem, and to all other people: forgive me posting
all around the world instead of mailing Theo the answer but maybe other
people could use this tip.

Herman.

4490. Re: my ideal cache program

Newsgroup: comp.sys.atari.st
Date: 1988-07-04 10:14:55 UTC
From: pes@ux63.bath.ac.uk
Message-ID: <2752@bath63.ux63.bath.ac.uk>
Source record: 251790

My (rather limited) investigations lead me to believe that your '(optional) read-ahead' -- i.e. convert sector reads to track reads and cache the whole track -- unless of course you've already got it -- probably offers the greatest potential for speedup. However, I haven't yet designed such a thing clever enough to deal with the fact that not all my disks are laid out with the same number of sectors/track.

Cheers, Paul

4491. Metacomco make under gulam

Newsgroup: comp.sys.atari.st
Date: 1988-07-04 12:37:51 UTC
From: cpm@datlog.co.uk
Message-ID: <811@dlhpedg.co.uk>
Source record: 251791

Hi,
Can anyone help me with a problem I'm having using the
Metacomco 'make' utility supplied with Lattice C V3.04 (I think the 'make'
version is 2.16).
I'm currently trying to port Nethack v2.2 to the atari ST and was
hoping to use MCC make under gulam to remove most of the drudgery. My
problem is that the make utility appears to have problems loading LC1.TTP
(first pass of the Lattice compilier) whilst running under gulam but
has no trouble if its run from the desk top.

It usually fails with an error 36 or 39 - The documentation says
these are TOS errors although I haven't been able to track them down yet.

I'm running all this on a 520stfm with two 1meg disk drives (I
upgraded the internal one), with gulam,lcc,make etc in drive A and the
sources and the makefile in drive B. I also occasionally use a ram disk
(drive D) of 100k - but I've tried it without so I don't think its lack
of memory.

What I really wan't to know is , what do the error messages mean ?
(and where can I find a complete list) and has anyone else had problems
or success using the MCC make ?

Alternatively, could anyone suggest a better make - preferably cheap
or PD - perhaps even a posting ? The only requirement is that it should run
under gulam with the sort of configuration I've outlined above.

Thanks in advance for any help,

Paul.

4493. Mega Bug?

Newsgroup: comp.sys.atari.st
Date: 1988-07-04 22:26:22 UTC
From: trb@stag.UUCP
Message-ID: <513@stag.UUCP>
Source record: 251793

Has anyone had problems with programs 'losing the mouse pointer' on Mega 2 machines? We recently purchased 20 Mega-2 monochrome systems at ETA (as part of our summer Superquest project) and have seen this problem on 5 or 6 of the ST's. We primarily see it when a student is using Unix Windows (the Lachman version), has several terminal sessions going on the screen and then moves the mouse up into the pulldown area. The pulldowns will start reversing when they shouldn't (i.e. messing up the top line) and when the mouse is moved out of the pulldowns and the pulldowns are dropped, the mouse disappears. I wrote a little desk accessory to allow turning off of the mouse, but then you get these 'patches' on the screen wherever you use the mouse. The mouse is very useful in the Lachman version of UW, since it allows cutting and pasting of text between windows, dynamic scaling of windows, and scrolling up and down in tall thin windows. I would normally think it is just a bug in the UW software itself, but the problems seem 1) to be intermittent on a machine basis, and 2) don't appear at all on some machines. If anyone has any ideas, please drop me a line.

Some related info: We have currently set up the students using the following software:
1) UW - allows multi-session use on the Silicon Graphics workstations. This lets the student open a window up for telnetting over to our ETA10 supercomputer, and then do local compiles, edits, rogue playing, etc in other windows. Logging to up to 7 files simultaneously is great.
2) Uniterm - Unfortunately, UW doesn't support kermit or xmodem, so Uniterm gets used heavily for file transfers between the ST and the SG.
3) Absoft Fortran - Great fortran compiler. The students do most of the preliminary compiles on the ST, since that way they
get the fastest feedback, have the fastest editor, and
can do their work at home or when the Unix system is
'busy' (i.e. hung, rebooting, or otherwise tied up).
4) Tempus - Very, very nice editor...could use a few more key options, but its speed and power make up for a lot.
5) Micro C shell - For those who hate Gem...also, this allowed the students to become familiar with the C shell before they arrived
at ETA (although how they all seemed to know about rogue
I'll never know).
6) Word Writer - Nice, inexpensive word processor.
7) Publisher - Nice, DTP package by Timeworks.

I would like to thank Atari (Sig in particular) for helping out in this project. We invited Sig Hartmann out to ETA about 3 weeks ago and he was so impressed with the Superquest project that Atari ended up donating two DTP systems for the project (Mega-2 ST's with Atari Laser printers). I think this type of involvement (associating Atari ST's with supercomputers) could really help out Atari's credibility in the business community. After all, MOST of us know

already that it makes a very powerful development machine.

Some asides:

If any of you are using Silicon Graphics workstations (CDC 910's), we have a version of the unix windows server that actually works. Drop me a line if you need it. This is a modification of the 4 file uw distribution, not the more recent 20+ file mac version of the server. It is kind of half way between BSD and SYSV (i.e. we are using INET sockets, but SYSV terminal routines, and some really strange pseudo tty stuff).

BTW, Sig, if you read this, thanks for inviting me to visit out there. I had a blast talking to everyone. I've tried EMAIL'ing you, but site 'sun' seems to be inaccessible (assume that is your sites' feed). And during the day, I've been run ragged helping the Superquest students out...very, very sharp kids, so playing phone tag wasn't practical. Within one week of arriving, some of the students were generating output on the supercomputers and displaying graphic displays on the Silicon Graphics workstations.

...
Sorry, I should have provided the reference:

"Kermit Protocol Manual" by Frank da Cruz, Sixth Edition

Page 24:

"Y I agree to 8-bit quoting if you request it (I don't need it)"

(This manual does have the advantage of being free).

So the question is: how compatible is Frank da Cruz with himself? :-)
Anyway I don't see why the Protocol allows 'Y' in a response to a
send-init packet, it being totally redundant (as the table you quoted
shows nicely).

Hmmmm, I would suggest waiting for the new TOS version first (which hopefully
isn't all to far away) before spending all too much time on a project like
this.

In article <409@laura.UUCP> klute@trillian.UUCP (Rainer Klute) writes:
>Recently a floppy disk cataloging system, STDCAT, was posted to
>comp.binaries.atari.st. It claims to be able to catalog
>floppies with a folder level up to 16. However, I failed in
>cataloging one of my floppies which has only 3 (three) folder
>levels. This disk has, however, *many*, *many* folders on the
>2nd level (I haven't counted them 'cause I can't count so far
>:-)).

I have reproduced the problem with a disk the has only 17 directories,
all at the root level on the disk. The program is counting directories
and not directory levels. So any disk with more than 16 directories
won't be loaded. This is a bug and rather than change the
documentation :-) I have a patch for binary that will set the number
of directories on the disk to 1024. However, if you
apply this patch and try to load a disk with more than 16 directory
levels the program will blow up (this effectively removes the check).

```
OFFSET CODE
------ --------
OLD 0x661A - 0c790011
NEW 0x661A - 0c790400
```

Just use your favorite binary file editor and change the 0011 (17) to
0400 (1024). OFFSET is from the start of the file.

>I tried to reach the author by e-mail but failed so I post it
>here asking for a correction.

I am working on the mail problem. It takes forever (literally) to
get a reply :-).

>P.S.: Another nice enhancement would be the possibility of
> giving a comment to every single folder and file.

I am working on a new version with at least the following new features:

1) Folder limit bug fixed.
2) One comment per file or folder.
3) Next and Prev buttons on comment, volume and update
dialogs to help speed up doing lots of comments, volume
changes and updates.
4) Delete a disk from the catalog (with option to renumber).

If you have a new feature or a bug to be fixed in STDCAT V3.0 you
can try to e-mail me.

Now THIS is what I was wanting (and sort of half expecting) to hear! Why on Earth couldn't somebody at Atari has told us this to begin with, and put an end to all the foolishness? (Assuming, of course, that *this* posting is correct :-)) I still haven't gotten any useful info from the phone number the atari guys posted awhile ago, but I'll be happy to leave the issue at this.

4499. Re: Hard Disk auto folder problem

Newsgroup: comp.sys.atari.st
Date: 1988-07-05 17:57:54 UTC
From: mgr@pixar.UUCP
Message-ID: <1951@pixar.UUCP>
Source record: 251799

Yes, life is rough when you've got a bomber in your auto file.
Catch 22. Try this procedure:

0) Turn off all power to both drive and computer.

1) Open up the hard drive case by removing the obvious
black hex screws. Don't rip out the twisted pair
going to the indicator LED.
2) Change the drive select dip switch by flipping switch
1 to the opposite position. This will stop the ST
from recognizing the drive.
3) Leave the cover off, and bring up the power. Allow boot
from the floppy to proceed, and then flip the dip
switch back to its original position. Timing matters
here - wait until you hear the floppy heads move.
4) Install the hard drive, and remove the stuff in AUTO.

My understanding of the problem is that the SCSI controller needs to
be reset before it may be used, and this happens only at boot time.
you've got a klinker in the AUTO folder. Maybe others will have
refinements on this technique.

As long as I'm here - I've got a related and very basic question.
I've got all my equipment powered from a single outlet strip, yet
simply powering everything up is not a reliable way to boot. I
always wind up having to hit the reset button on the back of the
machine. And my choices are either to insert a floppy into a
running, partially booted system, power on with the floppy inserted
(danger Will Robinson!!), or leave the active light staring at me
until after boot is completed. Lets limit conversation on this
to three followup articles - thats what its worth

4500. Problems with Uniterm and Xmodem transfer

Newsgroup: comp.sys.atari.st
Date: 1988-07-05 19:42:45 UTC
From: zzkj@gos.ukc.ac.uk
Message-ID: <1538@gos.ukc.ac.uk>
Source record: 251800

I was trying to use Uniterm today to receive a file via Xmodem from a friend, and just couldn't do it. I was using a Hayes modem, Waiting for him to ring me and doing an ATa to connect to him. The modems connected happily so I hit ALT-T (after setting Xmodem mode), selected receive, typed in the filename and the instant I clicked on OK, my modem hung up. I've never had any trouble with the modem (a PACE Series 4 2400S) and Uniterm (V2.0c) before, but then again, I've never used the Xmodem before with the modem (although I know the Xmodem works as I have succeessfully used it when directly connected to another micro). Am I doing something wrong, or have I fogotten to set something up? My ST is a Mega 4 (with a blitter!!!! - yes, some of them do get shipped with them), a hard disk using the Supra Hard disk software and the only two desk accessories are The Control Panel, and something called Control Panel++ which gives me a RAM disk and a couple of other nice facilities. I have never had any clashes between any of these before so whats up???
thanks in advance for any replies (I can't mail non JANET sites)
Zareh Johannes
P.S. when I say that my modem hung up, I mean that it dropped (i.e. hung up) the phone line; I don't mean that it crashed (i.e. hung up)

4503. Supra hard drives

Newsgroup: comp.sys.atari.st
Date: 1988-07-06 01:24:58 UTC
From: cochrane@spot.Colorado.EDU
Message-ID: <6944@sigi.Colorado.EDU>
Source record: 251703

Thanks to everyone who mailed a response to my query about Supra hard drives! I ordered a Supra 20 meg, which arrived Thursday, and it's marvelous. (One small problem: the new model has a clock, but there's no documentation and I haven't been able to figure out how to have the software included with the drive automatically set the system clock when turning on the ST (I assume that's what it's supposed to do). If anyone who has the new Supra model has figured out how to do this I (and probably some other new Supra owners) would appreciate hearing the details - thanks).

For the benefit of those who may be considering buying a Supra, I am including the replies sent to me (slightly edited for space). If, after reading these, you suspect that I have excluded the negative responses - I didn't; there weren't any.

From: leo@cs.Buffalo.EDU (Leo Wilson)

I have had mixed experiences with Supra 20MB drives, so I thought my pennies might be useful despite the zillion responses your request is going to generate.

First, my own drive: Supra 20MB (really miniscribe 3.5" 20MB), no daisy-chain plug: Noisy, but it works like a champ. I've had it for > 2 years, and it has treated me right thus far. I treat it like a hard drive, meaning: I don't power it off or spin it down. Never. Well, a couple of times, but that's it. I don't jiggle or jostle it at all. It stays in one place, hasn't moved a millimeter since buying it. No problems. It IS noisy, though.

Second, my last employer's drives: Jeeze, they went through Supra 20MB drives like a spoiled kid goes through cotton candy at an amusement park. They were convinced (despite my admonishments) that they should shut them off at night, they kept them on jiggly typewriter tables, and they'd shove them around while running to accomadate papers they were working on. They drives lasted from four to eight months each.

So, here's what I suggest: If your situation is like mine, get a Supra. Nice drive, albeit a little NOISY. If your situation is like theirs, get an Astra drive. It's designed to be more physically robust. Seems a little quieter, too. Looks worth the extra $$ for the built in DS-DD floppy.

From: John R. Dunning <jrd@STONY-BROOK.SCRC.Symbolics.COM>

I bought a Supra 20 last fall, and it's worked flawlessly ever since. I heartily recommend it, esp in comparison to the Atari drivers. I know, they're built out of the same kinds of components, but I've heard of a lot more SH204s going bad than Supras. My only complaint is that I overflowed the thing too fast; after a while 20 Meg doesn't seem very big...

From: Marion Hakanson <hakanson@mist.cs.orst.edu>

I've had mine (the older 5-1/4" 20M drive, not the new 3-1/2" one) for two years. No problems so far. Their software is solid, too.

From: rutgers!sunybcs!sbcs!lean@ncar.UCAR.EDU

I ordered the 20Meg SUpra drive more than 4 months ago. The first one that i got has a minor problem. I called up Supra the very day and was advised to send it back. I did and a new one was sent back to me within 6 days (i'm on east coast. supra is on west coast). Very fast turnaround. I was happy.
I've used that drive since and haven't had the slightest problem. However, the fan makes a little noise (as in some frives). Do see and listen to one personally. I have no regrets buying it.

From: Scott R. Chilcote <dunike!xanth.cs.odu.edu!isis!src>

I regularly use a BBS in Norfolk, VA that is run on an ST with a 20 Meg Supra Hard Drive. This drive has been run 24 hours a day for a year and a half, and has suffered no mechanical problems.

Two things: Supra drives, for the last year, have usually come with a plug on the back for an additional drive. You can use an inexpensive bare drive since the controller can handle two simultaneously. Make sure your drive has one if your interested.

Supra can make goofs now and then. The store that runs the board received one Supra HD that had an unshielded cable--and did not work properly at all! After calling them the cable and interface were replaced quickly and at Supra's expense. They claimed that it had been shipped "by mistake."

A couple of times files on the BBS have been found to be glitched, but this is not the fault of the drive. Some programs, such as games made to be instal-led on hard drives, do not handle them well. Small FAT errors can affect other programs and cause headaches. The only cure is to keep regular backups in a safe place. Even IBM drive owners have those problems!

From: Dave Allum <mcvax!ux63.bath.ac.uk!sc_dra@uunet.UU.NET>

I've had one for a year now and have had no trouble with it.
It appears that not all Supra 20M units have the same drive,
mine is a fanless MiniScribe 3 1/2", so it's worth checking
what they are currently shipping. The supplied utilities -
formatter, sector editor, autoboot etc. - all work well. All
in all I have no complaints. At the time I bought it it was
cheaper that the Atari equivalent (and a *lot* smaller), that
difference may no longer apply.

From: stag!dynasoft!john (John Stanley)

Jim, I've been using a Supra-30meg hard disk for close to two
years. The only problems I've had were when I've parked the heads,
turned off the drive, turned the drive back on, and then (without
rebooting the ST) tried to access the drive before it had finished
powering-up. Needless to say, this was my own damned fault for
trying to get fancy with my use of the hard disk. As long as I wait
until it's fully awake before I try accessing it, there's no problem.
Needless to mention since this controller is probably almost three
years old, Supra may have fixed even this problem by now.

With the exception mentioned above, I've been very happy with my
Supra drive.

BTW, last time I checked, it was not possible to cycle the Atari
hard disk off and then on and then access the drive without rebooting
the ST. This is one distinct advantage of the Supra. It allows me
to do 90% of my programming without having the distraction of a hard
disk whurring in the background and still allows me to easily get to
tools on the hard disk if I need them.

> the same number of sectors/track.
>
> Cheers, Paul

No, you wouldn't be able to figure out exactly what a track was, but
it wouldn't seem that it would matter all that much... The things that need
the most speedup are the floppies, so you could use the Sectors/Track value
from the floppies (Of course, there may be problems there too, due to the
different formatters running around), and just use the same value for HD
buffering. It would seem that even though you'd get more seeks than would be
completely optimal, it'd be an improvement over the original (non-buffered)
scheme.

Of course, you could have a config (or run-time if it were a DA) that
would allow the user to set different sector/track ratios for each unit (drive
letter, whatever you want to call it), with reasonable default values. This
would allow for a very respectable speedup for those who don't know much about
the guts of their machine, and a larger speedup for the techies in the crowd.

4505. Hard disk problem.

Newsgroup: comp.sys.atari.st
Date: 1988-07-06 03:33:55 UTC
From: parkb@csri.toronto.edu
Message-ID: <8807060453.AA22622@bloor.csri.toronto.edu>
Source record: 251705

(Hello world...)

I wonder if some knowledgeable person out there could help
me with a hard disk problem. I have a 1040ST (11/20/85 ROM version)
and a Supra Drive 20Meg hard disk which came with a version 1.1
'supboot.prg' boot up program. My disk partitions are
C: (7Meg), D: (4Megs), and E: (the rest).
It seems that some internal directory table is being wiped out every
and then, causing the system to report back to me that the entire
harddisk has been erased. When the poor computer is reset, all is
ok. A guaranteed method of reproducing this consistently is to
click the 'show info' option in the GEM menu for, let's say, the
E: drive. This will return the correct disk usage; but when it
is invoked immediately on D:, it will report 0 bytes used on D:.
Thanks in advance.

4506. Obliterator ---a game!

Newsgroup: comp.sys.atari.st
Date: 1988-07-06 04:13:00 UTC
From: Friesen@HIS-PHOENIX-MULTICS.ARPA
Message-ID: <880706041352.563066@HIS-PHOENIX-MULTICS.ARPA>
Source record: 251706

Well, this last weekend I went to my local Atari dealer, and purchased Obliterator. This game is one of the best I've seen for the ST, the graphics are great, sounds are good, and action and game-play are excellent. The only thing I didn't like was that when a lot of things are on the screen, it gets slow. This game is hard, but fun. It took me four days (about 20 hours of playing) to complete the mission. There is one last thing, you control your player by an icon panel at the bottom of the screen (you can use the joystick or mouse, but it's not recommended) and I think if they had written some better joystick handling routiens, it would be a little better to use the joystick, but this game is still great, I definetly recommend this game.

The basic game is that you must collect weapons, amunition, and peices of the ship in order to disable it. Basically you shoot everything in sight, but watch the level of your amunition. As you get to certain points of the game you can save it to continue later. I really can't do it justice, you had better just go out and buy it! :-)

P.S.

On the back of the box it shows the guy shooting up, I have only been able to shoot sideways, if anyone figures how to shoot up, please let me know.

P.P.S.

Here is a hint on control (if you don't want the hint don't read this) the only time you should use the joystick is when you are wearing the jet-packs, at least that is what I've found, but experiment yourself!

Message-ID: <880706041922.820370@HIS-PHOENIX-MULTICS.ARPA>
Source record: 251707

Well, this last weekend I went to my local Atari store (a twenty mile drive through downtown and terrible trffic) planning on buying Spectrum 512. I arrived there and started talking with the head of the newly founded ST users group here. He convinced me that I wanted Quantum paint because it dosen't flicker, and it offers over 4,000 colors (of coarse he didn't actually own the program, he had just seen pictures made with it). Well I decided to purchase it (I should have known I was in trouble when I realized it was $20 less than Spectrum 512). I took it home and quickly found that its painting tools were very limited, that it had a terrible way of handling the 8 palates in its medium mode, that colors flickered in its 4000+ color mode, and that after you put a little time into a drawing, it bombed the system, and it took two resets to get to the desktop. The next day I returned it and purchased Spectrum, and am very happy, I love this gradient fill feature.

Summary...

I think that the only thing Quantum Paint is good for is for (mabey, I didn't use it for this) is video digitizing or to be able to say that "My ST has as many colors as that dumb ol' Amiga.":-)

Concerning Leo de Wit's program to read characters from screen:

PLEASE NEVER NEVER NEVER do VDI-calls with a zero-handle. Valid VDI handles start at 1! Calling a VDI-function with zero-handle will result in an error when working with Atari's brand new GDOS (AMCGDOS)!
What's true: the desktop WINDOW used by the AES has handle nr. 0. This is very different from VDI-*DEVICE*-handles!!

Hmm, maybe the american 520 STM does. The "original" 520 ST (no M!), 1040 STF
and the like does not. All You get here ist RGB-analog; my VCR can
handle that...

4514. UW server sources on lakesys

Newsgroup: comp.sys.atari.st
Date: 1988-07-06 18:48:22 UTC
From: martin@lakesys.UUCP
Message-ID: <797@lakesys.UUCP>
Source record: 251714

I have a new distribution of the sources for the server side of UW, my appologies to those who spent time with the files and couldn't get them to compile...

If anyone would like to help me make sure the code I have now will work out (and you have access to a BSD system). Please let me know. I understand that the sources may be modified to compile on SysV as well, but it is beyond my expertise.

Until this mess gets straightened out, I'm removing uwserver from lakesys.

BTW, Thanks, everyone for your support. We're always looking for more contributions! :-)

Those of us on this side of the Atlantic could benefit from the existence of such a program. I, at least, could. Please make this information available since there is a scarcity of statistical software for the ST here. .

4518. Which C Compiler? (another war? we'll see...)

Newsgroup: comp.sys.atari.st
Date: 1988-07-06 21:59:28 UTC
From: exodus@mfgfoc.UUCP
Message-ID: <374@mfgfoc.UUCP>
Source record: 251718

Okay everybody....

I have been trying to get a PD version of TeX going for a while
now. I have gotten two different versions of TeX in C under
two different C compilers to pass the trip test. The problem is that
both compilers get too buggy after the sizes of arrays get too big.
I posted a bug report for MWC 3.0 last week. TeX just will not
run with arrays set up to handle plain.tex or lplain.tex. I
have nearly given up on the compilers and I am going to compile
the sources on a Sun with gcc and assemble the resulting assembly code
on the ST's. I'd like to hear a better solution, but this seems
to be the only solution at this time.

How debugged has Manx C become? Anybody out there care to discuss
this? When I tried it on TeX, it was somewhat buggy in the
'Portability' mode.

Actually, I am not really sure it is any different at all. Is it any different from someone writing a "new" program and selling copies of it -- since any salable program has to be a lot like other, previously sold, programs or no one will have any idea what it is for. The whole point of copyright is to give away as much of the store as possible, and still keep the storekeeper from starting a revolution (I don't know who said that, but it is pretty accurate!). And if anyone thinks the whole copyright schtick makes any sense at all, compare the recent rulings in Canada and Louisiana. I believe no rational individual can agree with both!

Charles Marslett

4520. Help about MT C-Shell

Newsgroup: comp.sys.atari.st
Date: 1988-07-07 06:07:16 UTC
From: fischer@netmbx.UUCP
Message-ID: <2055@netmbx.UUCP>
Source record: 251720

I've just bought the MT C-Shell from Beckemeyer Development Tools and I've two problems :

1) Has anyone rewritten cc.prg for the Lattice C (Metacomco) Compiler and could post me the prg ?

2) I'd like it much more to have white letters on black ground but when I start the C-Shell from the AUTO folder the normal screen appears and I have no idea how to set it revers. Is a chance to do so from the Shell (maybe include a litte prg call in my login.sh) or a program I put before the MT C-Shell in the AUTO folder.

Any help would be greatly appreciatet I'm stuck with this problem.

Thisproblem was dealt with by an article in STart a year or so back.
They told you how to create a floppy that would always be booted from
even in systems where the normal booting is from the hard disk and
even if there was no procedure for forcing a boot from floppy.
I now have such a floppy (even though I don't need it because I can force
the floppy boot via Control-Shift_Alternate.

Don't exactly remember how it was done.

4523. Powering on (was Re: Hard Disk auto folder problem)

Newsgroup: comp.sys.atari.st
Date: 1988-07-07 09:14:10 UTC
From: pes@ux63.bath.ac.uk
Message-ID: <2766@bath63.ux63.bath.ac.uk>
Source record: 251723

At home, I've got everything powered on one block, and just put in my floppy and flip on the power. Works OK. There *might* be some minimal sequencing (for relevance, read on) owing to the fact that my keyboard unit and disk drives are on the far side of a transient-suppressor from everything else (monitors, printer, modem).

At work, where I have to manually switch each thing on individually, I've found two rules that seem to apply (experimentally). First (well known and obvious) I power up the external disk drive before the processor (so that the processor will recognize its existence during boot). Second (maybe less obvious), power on anything connected to serial and Centronics ports BEFORE powering on the processor -- or else leave them until the system has finished booting. If either of these (my work printer is prone to) generates a spurious interrupt during some window while the machine is booting, you seem to end up in a bomb loop.

4524. Re: my ideal cache program

Newsgroup: comp.sys.atari.st
Date: 1988-07-07 09:20:29 UTC
From: pes@ux63.bath.ac.uk
Message-ID: <2767@bath63.ux63.bath.ac.uk>
Source record: 251724

I was specifically worried about different sectors/track on floppies. (I can't afford a hard disk yet.) I run MOST (but not all) of my 'active' floppies at 10 SPT for the space; and MOST (but not all) of my 'archive' floppies (non-image backup) at 9 SPT because its 'approved' and so feels safer.

The problem isn't insurmountable (the system knows what the SPT of the mounted flopsies are); it's just finding a clean, release-independent method of getting the info into the cache routine, without using the offical TRAP call (since you're already in a TRAP handler) and without imposing unacceptable time penalties (like duplicate reads of Sector 0.

Biggest problem is that my present schedule isn't leaving me any time for playing with my ST, and the cache is pretty far down my play list.

Sigh.

4525. Mono monitor problems

Newsgroup: comp.sys.atari.st
Date: 1988-07-07 09:39:50 UTC
From: chaz_heritage.WGC1RX@XEROX.COM
Message-ID: <880707-024028-1553@Xerox>
Source record: 251725

In his 23 Jun 88 05:24:11 GMT John Joubert writes:

>My monochrome monitor shakes also. A friend of mine has one and it shakes and has a strange kind of tilt to it also. Anyone know of a good remedy?<

Round the back of the monitor are three tweakers, called VHOLD, VSIZE and HPHASE. VHOLD controls the stability of the picture; if it is misadjusted then occasional twitches or picture rolls may occur. Tweak this until the picture rolls continuously, then tweak it back. The picture will stabilise, and, as you tweak VHOLD further, start to roll again. The midpoint between the positions at which rolling starts is a reasonable optimum.

VSIZE varies the vertical size to allow circularity to be set up; HPHASE varies the horizontal position of the picture on the screen. Display a perfect circle and adjust VSIZE until its X and Y diameters, measured on the screen, are identical. Adjust HPHASE for optimum centering of the image on the screen.

If, having done this, the picture still shakes then it may be the result (particularly in old monitors) of contamination of the tracks of the tweakers. Careful application of a suitable cleaning spray (I could recommend some, but you probably can't get them Over There - ask for 'switch cleaner' or 'computer solvent / lubricant aerosol', etc.) may clear this fault. Working the control to and fro while injecting the cleaner (from inside the panel) seems to work best. NEVER DO THIS WITH THE MONITOR SWITCHED ON.

Failing that, the fault is probably due to a capacitor being on the point of failing somewhere in the tube drive circuit. This would require service center repair.

I assume that by 'tilt' is meant tilt of the image on the screen, rather than mechanical tilt. The former may be adjustable by an internal tweaker or it may be set by the alignment of the magnetic yokes and / or compensating coils on the tube neck. It is often quite easy to adjust these, but please get the Atari service manual for the monitor and follow its instructions TO THE LETTER if you're gonna do this. If you fry yourself on the HT don't blame me.

Oh yeah, and if you DO get a copy of the service documentation I'd really love a copy of it..... my mono monitor's only a couple of months old, so these 'internal' suggestions are generic to mono monitors in general. I've not taken mine to bits yet.

<take that you nasty, filthy, pig-dog line eater, HA!>

OK, I'm about to shell out $$$ for a 'be-all, end-all' MIDI
package for the ST and I want some info on Hybrid Arts SMPTEtrack
package. I would like the following points addressed if possible:

1) Ease of use (ie - different modes, step mode, graphics, etc.)

2) The SMPTE feature

3) Copy Protection (if any, how does it make life difficult?)

4) Recommended System Set-Up

5) Nifty Features (ie - HybriSwitch, patch ed/lib stuff)

6) Approximate Retail Price (where can I get the best deal?)

7) Any known bugs, quirks, problems, complaints

I think that should do it. I have already checked out Dr. Ts KCS
Level II with MPE and was suitably impressed, now I am checking the
competition.

Thanx,
Rick Random

Well, in PIM2, 3rd Edition (in german, the only I have at hand at
the moment) Wirth describes in chapter 31 about "device
processes, concurrency and interrupts" (translated from german,
may vary in english) a possibility to give the absolute address
of a variable on a pdp-11 by saying:

```
VAR s[777560B] : BITSET;
x[777562B] : CHAR;
```

Try, whether your compiler groks it. (I doubt it.)

> folder instead of the hard disk auto folder ?
>
> Theo

Hi, out there,

all the replies I read by now are about the second part, I think something else is much easier and more appropriate to Theo's specific problem.

I recently saw a program called 'Loader', which has to be the first program in the auto-folder. It then shows you all programs in the autofolder and asks you which programs to execute. Afterwards it does the same with all accessories.

It works very simple as follows:
All programs selected to be executed are renamed to name.prg, the others to name.tos.
As only *.prg files are executed in the auto-folder only the selected programs are executed after exiting the loader.
With acessories it works the same way (renaming unselected accessories to name.acx).

Unfortunately I don't know if this program is public domain, I can't access it at the 'mo. But it shouldn't be a big problem to write it yourself.

Hope this helps you,

Matthias

4531. Degas compressed format

Newsgroup: comp.sys.atari.st
Date: 1988-07-07 14:17:00 UTC
From: MCCABE@MTUS5.BITNET
Message-ID: <8807071458.AA22686@ucbvax.Berkeley.EDU>

Source record: 251732

I'd like to know if NETLIB@LAKESYS.UUCP is reachable from BITNET. The recently posted directory listing contained a number of interesting files that aren't available on BITNET (at least, not to me :-). I sent a number of mail files following the directions in the directory postings. I received: nothing, i.e. no mailer error messages. I suspect there is a problem with the return path. Has anyone on BITNET managed to get NETLIB to answer ?

Also, I could not get mail to George Woodside, the author of TURTLE. I used addresses like woodside@ttidca.UUCP-USA or the path his postings have (pyramid!prls!philabs!ttidca!woodside@decwrl.dec.com), but nothing worked.

George, if you are reading this:

I noticed that you said the newest TURTLE version to be 2.18. I wasn't able to find that version on any of the servers available in BITNET. Could you tell me if 2.18 exists on a server on BITNET ? Alternatively, could you please e mail me a copy directly, if it's not too much trouble ? I want to retry using TURTLE on my Mega4 and I want to be sure to start off with the newest version.

Thanks for any and all help.

Source record: 251733

In his 27 Jun 88 21:10:32 GMT Gregory Gibson writes:

>I want to connect my Atari color monitor to a VCR. Where can a find a device that will perform this task?<

You can't. The Atari colour monitor is an RGB type, and has dedicated RGB outputs from the ST. There isn't, as far as I know, any output from the monitor at all.

What you should do is buy a spare Atari monitor plug and socket - you can make these yourself from 0.1" pitch board, pins and sockets if you have to - and make a 'breakout box' for the composite video signal which is simultaneously available. Take this signal (together with the line audio, if you need it) to the line inputs of your VCR. A composite monitor can be connected to check the VCR through signal if you like.

This won't work with a monochrome system because the sync rates are too different from standard to work the VCR.

You can't feed the RGB signal directly to the VCR unless it's one of the very expensive professional type which have RGB inputs. These are not very common.

>How good are the picture and sound quality?<

Picture not quite as sharp as RGB (because it's been through a coder and decoder) but much better than using the modulator, which adds another batch of noise (though if you're desperate hook modulator RF out to VCR antenna in and tune of of the tuner channels to Channel-36 or whatever). Audio probably better than the Atari monitor audio (which has a cheap little speaker).

If you get any problems email me and I'll try to sort it out.

You're right; the graf_handle() function can be used to get the desktop's
handle.

B.T.W. I was a bit puzzled, because the VDI call has nothing to do with
the program; it was merely a remark about getting the cursor position.
The program source followed in the same posting, but doesn't even use
VDI or AES (only a Line-A exception is used to get the font
parameters). It should be correct as it stands.

Leo.

4535. Re: Jos Vermaseren - Posting GEMDOS ... (illegality)

SIMPLE, LEGAL (?) Solution:

Write a program to output the assembly (with labels, comments, etc)
but using the contents of the ROM to produce the actual assembler
code. Everybody who bought an ST has the ROMs (maybe a few people
still loading from disk?).... their ROMs plus labels and comments
doesn't constitute a crime, does it?

Package: disassembler
comment-field files for each ROM version
symbol table/label info for each ROM version.

Requires some work, eh?

4536. A ghost in the house

Newsgroup: comp.sys.atari.st
Date: 1988-07-07 19:32:54 UTC
From: stdnet@stag.UUCP
Message-ID: <515@stag.UUCP>
Source record: 251736

From: dynasoft!john@stag.UUCP (John Stanley)

This normaly would have been sent as a personal email response,
but since it effects all users of Mark Johnson's C (MJC) compiler
I decided to post this to the net.

Hi Steve!

In comp.sys.atari.st, thelake!steve@stag.UUCP (Steve Yelvington) writes:
>
>I compiled a directory lister with Mark Johnson C, version 2.0.
>It works just fine, but at the end of the directory, it prints out a
>message on the console: "(no more files)".
>
>This message is nowhere to be found in my program or in the MJC library.
>So I figure that either it is coming from GEMdos, or I have a friendly
>ghost. I want it to go away.

Steve, I guess you could say I'm the "friendly ghost". :)

The message you mentioned is one of the standard error code
messages in my JSH command shell. I'm assuming you're using JSH?

When a stand alone program returns a negative exit code, JSH
interprets it as one of the standard GEM/BIOS/XBIOS error codes and
prints out a message. My guess is that you exit the program by just
falling thru the bottom brace in main() rather than issuing a
return(0) or exit(0).

What happens then is a standard ambiguity/problem with the C
language. Many textbook programing examples show a main() procedure
that just ends. But, some also show the program using return(n) at
the end of the program to return some positive condition code or
negative error code. Unfortunately, there is -no- way to implement
the standard crt0() function (the startup code that actualy calls
main() -and- the code which determines what exit value to return to
the system) in such a way that it can tell if you return() or just
end out of main(). (Note: some compilers actualy force a phantom
return(0) at the end of main to avoid this problem...)

In MJC, this means that if you don't use exit or return at the end
of main(), your program will 'return' to crt0() with whatever happens
to be in the r0/d0 register at the time. In your case, this happens
to be the return code from the Fsnext gemdos call which ended your
directory scan.

Asside note: I disagree with the implementation of the startup
code that MJC uses, but I can easily see how Mark came to the
conclusions he did about how it should be written.

The -only- universaly acceptable way to write C main() functions is
to use return(0) or exit(0) as a normal termination, and to use
exit(n) to return an error or result code number to the system. If
you just fall thru to the bottom brace, or if you try using return(n)
with anything but 0, your program is not portable and will fail in
various ways depending on the compiler and/or system.

>One of the local programmers (John Osawa, author of the Schizo desk
>accessory) tried my code with Mark Williams C and got no such message.
>He suggested that MJC's startup code may throw a switch, and mentioned
>something about Perror. I thumbed through "Atari ST Application
>Programming" (Pollack and Weber), but found no references to Perror.
>It's not in osbind.h. I found nothing like it in the MJC startup routines,
>either.

To the best of my knowledge, the MWC crt0() code totaly ignores the
return value from main() and requires that any return value other
than zero be returned using exit(n).

>
>So: What is Perror? How do I shut off this message?
>

Excelent programmer that he is, John Osawa is taking a long shot
guess and, in this case, missing... Perror (a standard C function)
has nothing to do with your phantom so I'll skip it for the moment.
To avoid this problem, just exit your main() routine using return(0)
or exit(0).

Does anyone has a STARTGEM Prg that works with Blitter TOS ?
I have used a startgem prg a long time on my 260 ST but now with blitter
TOS it doesn't work.
I have put STARTGEM in the AUTO folder and the program to start directly
after initializing GEM in the C:\ dir. But what have worked so fine on my
260 doesn't works now.
Problem : GEM boots the startgem PRG correctly, than initalizes the desktop
and ... nothing happens. Normally the program to start would now automatically
started.

If you have such a nice little tool please post it to me.

Thanks in advance !

-Axel

>
>Has anyone had problems with programs 'losing the mouse pointer' on Mega 2
>machines? [detailed description of problem deleted]

I've seen this problem on my Mega, but I thought it was a bug in the application, not in the ROM. On my machine, it happens when I accidentally drop a menu while the screen is being updated. My assumption that it was the application's fault was based on the fact that menus shouldn't drop while you update the screen, since one should "brace" the update code with a call that tells AES that you are changing the screen contents (I don't remember the function's name).

I had this bug happen with some applications, most notoriously with Uniterm and DLII, both by Simon Poole, both written in what's-it's-name Pascal, so I further suspected a bug in this Pascal's GEM support. I couldn't confirm it, since I haven't it, but I reported the problem to Simon. He never answered, though, so I don't know whether he really got my mail.

4540. Re: Network problems: please help

Newsgroup: comp.sys.atari.st
Date: 1988-07-08 07:16:00 UTC
From: PETCHER@FSU.BITNET
Message-ID: <[gw.scri.fsu.edu].180C0C00.009157CD.PETCHER>
Source record: 251740

The following has turned out to be a rather long response to the original posting, but I hope that it will be helpful to some others who are trying to access netlib from bitnet. It is basically a report on my not altogether successful experience.

Bitnet is my usual connection with the uucp world, and generally although there may be some initial problems in finding a working path, usually once that hurdle is past I have no problems. With netlib@lakesys my experience has been different. I have been accessing netlib from bitnet, but with minimal success. I have sent requests from two different computers. So far from the first, I have received somewhat more than half of the files that I requested over a period of about a month. (In this tally I only count paths to lakesys that I have some reason to believe are reliable - like I got a response). Some of the files I have not received may yet arrive though. From the second computer (the one from which this message originates), which uses the first as a gateway to bitnet, I have received absolutely no response from lakesys whatsoever. As an aside, I have also tried to send letters from the second computer using mfenet with no response.

On the index of lakesys software distributed to this newsgroup, the path 'lakesys!netlib@csd1.milw.wisc.edu' is said to be useful for some. Using this path I am unable to get a response, although I know that I am getting through at least to csd1. I sent a query there and got a response from the postmaster. However the postmaster at lakesys never responded to a similar query.

The path that seems most reliable for me is

'uwvax!uwmcsd1!lakesys!netlib%harvard@harvunxw.bitnet'

I have also tried other paths through other gateways that are usually good gateways to uucp for us, but in this case with no success. On a couple of occasions I got replies back from our mailer that attempts to deliver the letter have failed, although the mailer will keep trying to deliver for several more days. This means that the path is apparently good but it somehow cannot get through at the moment I suppose (some node is down?).

To sum it up, I suspect that there are sevaral problems possible. The most obvious are that either the path you use is not working, or perhaps more likely, that netlib is unable to interpret the return address properly and the return letter just falls somewhere into the great electronic abyss. Yet another thing I suppose (that can be confirmed by the lakesys people) is that there is a large backlog of requests so that the turnaround is very slow. This is no doubt due to the obvious excellence of the collection of software that has been assembled there (kudos to the organizers). I have no explanation for the sporadic experience I have had in receiving files when

I know the link I am using is a good one in both directions.

Is there a way to iron out these problems? Does anyone have a clue? (Marty, can you help?)

Alternatively, could the bitnet sites such as canad01 (I still can't get a response from houston) or better yet, could an ftp site stock the same software that is available from lakesys?

From: Mark_OBryan@UM.CC.UMICH.EDU
Message-ID: <3207639@um.cc.umich.edu>
Source record: 251741

Does anyone happen to know if the updated version of LightSpeed Pascal (v1.11, I believe), which now runs on the Mac II, runs on the Magic Sac or not?

I'm considering porting our Omni-Banker ST program (a universal MIDI librarian) to the Macintosh, and need to decide between LightSpeed and Turbo Pascal. If LightSpeed Pascal still does not run on the Sac, that simplifies my choice somewhat. :-)

Ho hum...Psygnosis have duped another poor soul out of his hard-earned
cash.

> This game is one of the best I've seen for the ST

Well you can't have many games then ! I suggest you look at Arkanoid,
Impact, Super Sprint and SideWinder...the 4 best games of all-time on
the ST (of course, Arkanoid and SideWinder are MUCH better on the Amiga !).

> The only thing I didn't like was that when a lot of things
> are on the screen, it gets slow.

This also, disgracefully, applies to the Amiga versions of ALL Psygnosis
games. They DON'T use the Amiga blitter !!!! They have a set of S-L-O-W
68000 routines which, I suspect, are very similar on the ST and Amiga.

> On the back of the box it shows the guy shooting up

I almost thought you meant he takes drugs during the game !

In conclusion : Haven't you noticed that the 'look and feel' of Psygnosis games
hardly changes from game to game ? I thought Barbarian had nice graphics, nice
sound, but was too S-L-O-W and ultimately a complete bore to play. Surprise,
surprise, the same could be said about Terrapods (all I ever do in that game
is shoot everything in sight until my ammo runs out - I LOVE the explosions ! -
and then switch off in disgust due to the lack of anything else interesting to
do). Now along comes Obliterator and I have EXACTLY the same moans about it -
it's yet another disk just waiting to be formatted...

>So: What is Perror? How do I shut off this message?

In Unix the function perror() prints out its string argument, followed
by a colon and an error message. This error message is from an array
(something like char *sys_errlist[]; but you don't have to declare it)
and is indexed into by the global int errno, which contains the last
O.S. error encountered. Probably your Perror behaves just like this -
maybe it is in the startup code with which MJC C binaries are linked
and activated when the last error encountered is non-zero (just
guessing). Most likely the GEMDOS calls Fsfirst and Fsnext are used
to scan a directory; when Fsnext fails at last - no more files that
satisfy the spec - it returns -49. I suggest you check the global
ints like errno (maybe there's also an oserr), print them out after
the directory scan. One of them will most likely contain -49.

To shut off this message you have two options: just set errno to
0 before exiting (or the global int that is 'responsible') or if
you dislike the 'automatic' Perror (I would) you could patch the
startup code with NOP's on the relevant place(s).

```
extern int errno;

errno = 0; /* and then leave main() or do exit() */
```

Hope this helps...

Leo.

I'm not a lawer, and I don't even play one on tv :^).

However, there was a program which performed exactly this process on the
CP/M operating system a few years ago. You pruchased the program, and ran
it on your operating version of CP/M. It wrote an assembly source file
which, when re-assembled, would re-create the configuration you were
running at the time. Of course, it didn't include dis-assembly of the
custom part of the BIOS (for you old hackers who remember writing CP/M BIOS
drivers. De-blocking sure was fun, wasn't it?).

The package, as purchased, included a dis-assembly comment file, and a
driving program which read the code present in the machine. It added
the text from the comment file to the code generated from dis-assembling
the operating system to provide the assembly source file.

This program, while not sold by Digital Research, was on the market for
a couple of years. I don't know if Digital Research ever went after the
authors of the program, but it seemed to eventually fade away from lack
of sales, after the first initial onslaught.

In any event, such a task for the ST ROM's would be a major investment in time
and effort. And, by the time it was completed, the new ROMs would be available,
right :^) ?

>mail me a copy directly, if it's not too much trouble ? I want to retry using
>TURTLE on my Mega4 and I want to be sure to start off with the newest version.

There is very little difference between 2.17 and 2.18, only a minor bug fix
for a rather unusual directory problem. There is a new version in the works
(isn't there always, with everything?), but don't look for that until sometime
in August. I am attempting to address the problems of more disk formats, and
assigning the RAMdisk to drives other than "M:". I am also looking into
reports of problems with 4M systems, but I haven't found a test site in the
Los Angeles area (I come from a poor, 1M family :^)).

I know the latest version is at lakesys. I'm not sure how to get it through
BITNET. If all else fails, mail me a disk, and I'll put the latest version
on it.

> package. I would like the following points addressed if possible:
> 1) Ease of use (ie - different modes, step mode, graphics, etc.)

Very easy to use.

> 2) The SMPTE feature

It works for me all the time. Very reliable, no problems
during the past year I've owned it.

> 3) Copy Protection (if any, how does it make life difficult?)

You can make as many copies as you want. The program
will not run unless the "smptemate" box is attached to the ATARI.

> 4) Recommended System Set-Up

I use SMPTETRACK ST with an ATARI 1040ST w/ the higher resolution
monochrome monitor. The resolution of the ATARI color monitor
is not as good as the monochrome monitor.

> 5) Nifty Features (ie - HybriSwitch, patch ed/lib stuff)

These are all extra programs. Although, there is a simple
version of their "Genpatch" librarian supplied free with
the SMPTETRACK package.

> 6) Approximate Retail Price (where can I get the best deal?)

I paid $400.00 from Guitar Schack in Chicago.

> 7) Any known bugs, quirks, problems, complaints

There is no automatic looping feature. You have to
link together multiple instances of one phrase (as
if you were arranging a song) to get a pseudo-endless
loop.

Hybrid Arts' BBS is free and anyone can access it by
calling 213-826-4288. You can converse with the developer
of the program, Stephan Daystrom, and suggest new features.

> I think that should do it. I have already checked out Dr. Ts KCS
> Level II with MPE and was suitably impressed, now I am checking the

> competition.

I hear about lots of problems with Dr T's stuff regarding their copy protection schemes and their incompatibility with some hard disks, etc. But the choice is yours. Talk to some owners of the other products before you make a decision.

I would seem that you bought the computer, with the ROMs, for your
personal use. Now, if you were to distribute the disassembly, you'd be out
of the arena of personal use, so that seems to be out entirely. However, you
bought the ROMs and therefore can do with them as you please (within the scope
of your personal use).

I'm not a lawyer (nor am I studying to be one). This is just an
opinion.

4551. Current VT-52 cursor location

Newsgroup: comp.sys.atari.st
Date: 1988-07-08 18:29:33 UTC
From: stdnet@stag.UUCP
Message-ID: <517@stag.UUCP>
Source record: 251651

>
> What is the location?
>
> In what format is the data stored?
>
> And is the data kept current, or updated only when a vt52 escape
> sequence that means "save cursor location" is sent to the CON device?

When the VT-52 "save cursor" sequence is processed (which is "\033j"),
the cursor location (row and column) is saved at:
*((WORD *) (aline - 334)) /* saved cursor column (x position) */
*((WORD *) (aline - 332)) /* saved cursor row (y position) */

In these examples, "aline" is a variable which has been initialized to
the base address of the Line A variables. This address is returned in
D0 and A0 after the $A000 (init a-line) instruction. As an aside, you
can also set the cursor position by setting the row and column values
and sending a VT-52 "restore cursor" sequence (which is "\033k").

THIS IS NOT a good way to find the cursor location. A much better
place to get the cursor location is the current cursor location cells
(kind of obvious, right?) which are located at:
*((WORD *) (aline - 28)) /* cursor column (x position) */
*((WORD *) (aline - 26)) /* cursor row (y position) */

These values may be read, but writing to them is another matter. In
addition to the row and column values, another location stores the memory
address of the first byte of the current cursor cell. This address must
be updated as well, and you have to be careful to check to see if the
cursor is reversed (blink-on or blink-off) before moving it. The cursor
address is at:
*((char **) (aline - 22)) /* cursor memory address */

There IS a cursor status byte which indicates that the cursor is reversed,
but it's location is currently not documented (** WHY NOT, ATARI! **).
If you want to read about what happens when TOS moves the cursor, I refer
you to p.436 of "Atari ST Internals" (the BIOS listing), and the surrounding
pages. Remember, however, that listing is NOT what is in the current
machines, but a close approximation.

Well there is a precedent for this sort of stuff. There was (and is) a company that sold a program and datafile that when run on a CP/M-80 V2.2 system would produce a commented assembly language version of the CCP and the BDOS. It did this by matching the comments to the disassembly while keeping track of such things as entry points and such which were at known places. I heard from a source I trust that DRI tried to stop him but couldn't. I do know you can still buy this program.

Paul:
There is a public domain make that you might try using (it's probably in
the archives), but I doubt it would help. Tos error 39 is "out of memory",
so I suspect that is, indeed, your problem. Gulam could easily be using
more memory than your 100K ramdisk.
In fact, I'm surprised you're having any luck at all. Have you actually
managed to compile NetHack on your machine? I've been trying to port
NetHack 2.3, using Laser C, and it takes me 2 double-sided floppies (for
source and object), an 800K ramdisk (for compiler, temp files, and final
output) and 800K of free ram. The final executable runs to ~400K. When
I have a completed and debugged version, I'll post it to
comp.binaries.atari.st. (Assuming it hasn't been posted already.)
--Eric
PS: I know there'll be a lot of people out there who will want hack soonest,

but *please* wait for the posting; I have to share this account with the rest of my department, and we can't handle large volumes of mail. Nor, unfortunately, will our account let us keep 1 Meg of sources around, so I can't mail them (sorry!).

>
> - Mark O'Bryan, Paradigm Software Products

Both LightSpeed C and LightSpeed Pascal require the 128K or
later ROMs, so they won't work on the current 64K ROM Magic Sac.
The updates made to LightSpeed Pascal for the Mac II were not
related to what ROM version it requires. Turbo Pascal doesn't require
the 128K ROMs so it will run on the current Magic Sac.

Hello ALL!

Just a quick note here to let everyone know that if you have comments or questions regarding our latest software release SHADOW, we (Paul and I) are available at this address.

We are the University Atari Computer Enthusiasts also.
And if you are familiar with ATARINET, I would like to announce that it may no longer be available as a service to the Atari community. The computing center is thinking of switching to LISTSERV, and during the transition, they are thinking of removing ATARINET.

The move to LISTSERV would mean increased maintenance for the staff, and they want to get rid of ATARINET under the rationale that it does not service or advance educational or research activities. (In reality I believe they want to get rid of us so they don't have to maintain it - on the average we get over 5000 accesses a month!)

If you have comments, arguments, or suggestions which we can use to defend our position, in order to keep ATARINET going (and under LISTSERV), we would like to hear your thoughts.

Thank you,
Michael Vederman

4560. Gulam problem

Newsgroup: comp.sys.atari.st
Date: 1988-07-10 16:57:00 UTC
From: jrd@STONY-BROOK.SCRC.SYMBOLICS.COM
Message-ID: <19880710165749.2.JRD@MOA.SCRC.Symbolics.COM>
Source record: 251660

I'm in the throes of porting GNU Make, and have run into what looks like some kind of problem with gulam. The symptom is: when Make decides it needs to execute a command, it formats up the command name and arglist, and hands them off to a CLI. My CLI-finding routine does the obligatory lookup thru #x4F6, and jsr's to the resultant address, gulam's command executing routine in this case. The command gets executed perfectly, but when gulam returns to me, large tracts of memory have been trashed, including my stack. As you might imagine, things deteriorate in rapid fashion after that.

Commenting out the actual JSR to gulam prevents the lossage. Pexec'ing the image directly causes no trouble. It happens repeatably (same garbage at same address) if I execute it a bunch of times. The same sort of thing (different values) happens with gulam 1.00.00.02 and 1.03.04.05. I'm not sure exactly what range of addresses are getting trashed, but it's at least in the range of a K or so, as I've dumped that much stack before and after the call, and seen it trashed.

Anyone out there ever seen anything like this, or have any idea how to go about tracking down exactly what's happening?

4561. Re: Problems with stiram desk accessory

Newsgroup: comp.sys.atari.st

From: Dave_The-Lord_Lewis@cup.portal.com
Message-ID: <7248@cup.portal.com>
Source record: 251661

Try using the Intersect Ram Disk software (if it is available to you).
It is also a desk accesory, but will allow you to remove your ram-disk
if needed. I, so far, have never seemed to loose memory when when
removing one. The newest version also lets you set up an INTRAM.INF file
which will automatically create a ramdisk for you on bootup. Otherwise
(if no *.INF file is found) you can size and create your ramdisk whenever
you need to, by clicking on the accesory.

Hope this helps!

I've used the Lattice C Make Utility under Gulam for almost 1/2 a year and
it's a fine utility. No need to take a PD one.
I've occured the same error like you when I first installed Lattice C under
Gulam.
The problem is, that make did not find the pathes correctly.
You must install the Compiler as followes to work correctly :
lc.ttp, lc1.ttp, tc2.ttp have to be in a commands dir. Than you compile
with -gPATHNAME where they can be found
lc11.ttp HAVE TO BE IN THE CURRENT WORKING DIRECTORY !!!!!!!
^^

If not, make or lc.ttp are unable to find Pass 1.
I really don't know why, but I have found it and now it works correct.

Hope that helps you !

-Axel

4564. Booting

Newsgroup: comp.sys.atari.st
Date: 1988-07-10 22:32:50 UTC
From: rob@kaa.eng.ohio-state.edu
Message-ID: <378@accelerator.eng.ohio-state.edu>
Source record: 251663

There have been several recent posting in this newsgroup to the effect that booting from a floppy is dangerous, that a HD might damage the data if started from an unparked state etc.

I don't think so.
Reason: It takes a digital circuit at most a couple of hundred microseconds to complete any power-up state races. In the case of the hard disk or a 5.25 floppy, the rw heads are removed from the media by means of a spring. This effect has to be overcome before anything can happen; this a mechanical phenomenon, it will take milliseconds. In the case of the 3.5 floppy, this device first has to slide open the door on the disk before it can even start to think about lowering the heads onto the media. If you listen during power-up, you will notice that there is a pause of about a second before the disk door slides open.

In summary, by the time the rw heads get to the point where they could do damage, the control circuitry has long since settled down. If there are problems, this reflects either a design error in the hard_ and or software, or a transient glitch.

CCD Pascal. I've noticed the same thing in UniTerm, running both on a
Mega 4 and a 1040 ST. I have also seen this phenomenon in other PD software,
so it may not be the fault of the Pascal GEM support. The moral of the story
is:
GEM software authors, use wind_update!

From: kirchner@uklirb.UUCP
Message-ID: <2536@uklirb.UUCP>
Source record: 251665

Hello,
just from a code-generator-writers point of view:

THERE IS ABSOLUTELY NO REASON TO LIMIT LOCAL OR GLOBAL OR ANY OTHER
MEMORY STRUCTURE TO 64K IN THE 68000.

I once wrote the generator for Pascal-SC (the one with those
unique features for numeric applications, but a good pascal anyway -:)),
and since numerics deal with large matrices etc. I had to access all
memory I could get. C uses the same access mechanisms as pascal, so
the same could be done there.

And this is how I did it:

All local variables and the globals also are accessed via an address-
register. Let me call them Al and Ag. As expected variables with
offset <32k are accessed via offs16(Al), or offs16(Ag).

If the offset does not fit into 16 bits, I generate:

```
movea.l Al,Ax ; Ax is a scratch register
adda.l #offs32,Ax ; now Ax points to the variable
move.l (Ax),Dx ; access it.
```

Now remember: the address in Ax can be reused for subsequent accesses to the
same variable, and it can be used with a 16-bit-offset to access other
variables which are 'near' the first one. So with a little optimization
ALL memory can be accessed with only little overhead, which must not be paid
when variables are 'near' the Al/Ag anyway.

(I would not like to write a codegenerator in the same way for an 8086/-286)

>Ho hum...Psygnosis have duped another poor soul out of his hard-earned
>cash.

Yeah! I agree. At Psygnosis I reckon graphic artists outnumber programmers
about 10 to 1. It's the old story "Nice picture, shame about the gameplay".
While I'm badmouthing game software, a friend of mine bought Carrier Command,
which has been hailed by airheaded reviewers as the new messiah/Elite, and was
severely dissapointed.

1. The enemy carrier cheats: it teleports from it's actual position
to it's apparent position sometimes (The docs lie).
2. There are long periods of doing nothing (like 10 mins travelling time
between islands)
3. If you are crafty enough to trick the enemy carrier in to a meeting it
takes only a few missiles to blow it.
4. The enemy carrier doesn't have amphibious trucks, it's amphibious!
(Docs wrong again) and moves faster on water than a plane at full tilt.
5. The enemy carriers planes are indestructable.
6. The strategic game is impossible since no factories get built.

On the plus side: It has the fastest, smoothest, solid 3D graphics I have ever
seen on any micro (The OS is kicked out so they use the fast addressing modes)
and if the game worked properly the concept is great.
Once again though "Nice picture ..."

4568. Animatic Demo Time Limit

Newsgroup: comp.sys.atari.st
Date: 1988-07-11 15:19:04 UTC

> could "try it out".

We (the author and the company) had a big discussion about the time limit.
Arguments in favor of the time limit were:

1) It keeps the demo from being useful enough to dissuade purchasing the
product. Granted, you can't save the films, but what's to prevent you
from using one of the PD "snapshot" programs which will save the screen
to a file while you're editing?
2) It's harder to hack the demo version into a "real" version that saves.
We'd heard that there are "demo" copies of Tempus that were made into
versions that save.
2) What's so bad about exiting and reloading after you get the message? If
you're working on something you really don't want to lose you probably
want to buy the program anyway.

Arguments against were:

1) It's annoying. Nobody likes being kicked out.
2) It's excessively paranoid.

Apprarently, we made the wrong decision.

We apologize for the annoyance caused by this "feature".
If there is a demand, we will replace the version in atari.binaries with a
new version which doesn't have the time limit.
If you don't want to download it again, write us or call and we'll mail

you a version with no time limit.

I put the file together based on replies from info-atarians, and no one
gave me a Degas Elite compressed format description (either that or I
got one but I couldn't decipher it well enough -- I can't recall).

Anyone who has a clear description of the compressed format, please
mail it to me and I'll re-post the file formats list.

4570. Need DTP for ST compatible with GEM (IBM) Ventura Publisher

Newsgroup: comp.sys.atari.st
Date: 1988-07-11 16:24:00 UTC
From: COMPOS01@ULKYVX.BITNET
Message-ID: <8807111931.AA04500@jade.berkeley.edu>
Source record: 251669

Our office is using Ventura (the IBM GEM version) for a newsletter we produce. I've been asked to be the editor. I'd like to use my ST for the main tasks of setting up the pages and then transfer the files to Ventura to print on the laser printer in the office. Are there any Desk Top Publishing packages that
1. Produce Ventura compatible files, or
2. Output standard GEM metafiles (which Ventura can read)?

Also, are there any user groups in the Huntington area (Long Island). I just moved here from Louisville, KY and would like to find some local groups or BBS to contact for ST info. And are there any groups connected with the New York Institute of Technology?

Please send replies to me personally as I don't read the net often any more. Note the two possible net addresses below.

4571. Re: Gulam problem

Newsgroup: comp.sys.atari.st
Date: 1988-07-11 16:55:09 UTC
From: roeder@sbsvax.UUCP
Message-ID: <531@sbsvax.UUCP>
Source record: 251670

I have had the same problems with my shell (Master V5.0). If Gulam allocates memory (for making history-entries etc.) inside a system()-call, TOS gives this memory to the currently running program (and this is your MAKE). After your MAKE has finished, the memory is cleared and all eventual housekeeping-information of the local Gulam-malloc() is erased. Because Gulam uses its own blocks of memory (about 16k) this problem shows up only after some time (when these 16k are all used up and a new Malloc()-call has to be done). There are several solutions to this problem:
- try to get enough memory to the local (Gulam-)pool before running your program,
- tell TOS, that the current program is Gulam (this is very difficult to manage), or
- make your programs data space resident by calling Ptermres(0,0L) (after Free()-ing all your locally Malloc()-ated blocks)
- inherit all your memory to the calling process (difficult, you have to access the list of allocated memory-blocks and change the owner)
- use Master, it has no such problems (:-)
I hope this will clarify the situation a bit.

Edgar

4572. Re: How not to boot from your hard disk.

If you don't have a bootable hard disk, do this:

Put a disk in Drive A which DOESN'T have ahdi.prg in the auto folder.

Do a cold boot. To get a cold boot, you have to turn off the power for
~10 sec (longer on a Mega), then turn it back on. Alternatively,
you can assemble and run the program below.

Now find a disk with AHDI on it (the one that comes with your hard disk
will do) and double-click AHDI from the desktop. You have to install
Drive C manually on the desktop (see your owner's manual).

************************************************************

If you have a bootable hard disk, do this:

Do a cold boot (see above).

After you turn on the power, your drive A light will come on (perhaps 1
sec or more from the time you turn on the power). Hit the Alternate key
now, and hold it down. Your drive A light will go out, then come back
on, and the hard disk won't boot.

************************************************************

CUT HERE FOR PROGRAM COLDBOOT.S

*****************************************************************************
* *
* COLD cold boot code: copy a bit of code to $8, then jump to it. *
* The bit of code clears RAM starting from its own end, until it *
* gets a bus error. Then it jumps to the start of the ROM. *
* *
* This will obliterate any eternal RAM disks, caches, auto-booting *
* hard disks, etc., and give you the coldest boot you can get without *
* turning off the power. Colder, on a Mega, because the RAM holds *

4573. A C compiler question

Newsgroup: comp.sys.atari.st
Date: 1988-07-11 19:12:06 UTC
From: frisk@krafla.UUCP
Message-ID: <352@krafla.rhi.hi.is>
Source record: 251672

I am looking for a new C compiler, which can compile programs with more than 64K in static arrays. The one that I have already (Megamax) is unable to do so.

Does anyone know if some of the other compilers available (Lattice,MWC,Lazer ...) can handle this.

I do not know of a version for Lattice, but the source is available from
our company BBS at (415) 452-4792 (type "bbs" at the login: prompt). The
changes should not be that difficult if you know the arguments to the
individual compiler passes (I don't so I can't do it).

> before the MT C-Shell in the AUTO folder.

There are two ways. A short program is not too difficult. The Setpalete
TOS call will do the trick. Another way is to simply use the Vt-52 emulator
escape sequences. There is one to change the background color and another
to change the foreground color. If the default colors of White, Red, Green,
and Black are set, then the following command will set the screen to white
characters on a black screen:

echo "\033b0\033c3\033E"

The double quotes are required so the the \033 sequences are turned into
ESC (octal 33). I hope this helps.

The shell in the CRAFT development system also allows child processes to directly call the (already) resident shell. This shell has none of the problems mentioned. It is true however that allocating memory during execution of a system() call is tricky, but judging from the original complaint about Gulam handling system() calls from the Metacomco make utility Gulam seems to have other problems as well. The original complaint stated that more or less random areas of memory got trashed (near the location to where the stack pointer points in the process doing the system() call to Gulam).

As far as I can see Gulam also executes the system call on the callers stack. This is very dangerous as the Gulam has no way predicting how complicated a system() call will be in terms of stack depth needed for parsing the command. Suppose the command to be executed is a shell script using multi level if-then-else constructs. I tried this calling Gulam from a program with about 1K stack space: you'll get a nice white screen followed by a hard reset...

If you continue to have problems like these you should get a copy of the CRAFT environment. This will solve all your problems regarding 'make' since it contains a full blown make, a C shell compatible shell (more than 100 commands), the fastest editor available on the ST.
Version 2.0 (just released) is available from:

4579. RE> Hybrid Arts SMPTEtrack....

Newsgroup: comp.sys.atari.st
Date: 1988-07-12 14:02:00 UTC
From: UUCJEFF@ECNCDC.BITNET
Message-ID: <8807131124.AA14540@ucbvax.Berkeley.EDU>
Source record: 251679

>OK, I'm about to shell out $$$ for a 'be-all, end-all' MIDI
>package for the ST and I want some info on Hybrid Arts SMPTEtrack
>package. I would like the following points addressed if possible:

1) Ease of use (ie - different modes, step mode, graphics, etc.)

I would not consider it overly difficult, but there are a lot of features
which need to be sorted out. I havent exhausted all of them yet,
usually you find one that works best for you and dont bother to use
others. The graphics edit mode is very nice for cleaning up mistakes.
The punch method is very straight foward, but as I understand it, it
is a very common interface. I got discouraged with the step mode on how
slow the process is, even my keyboard chops are good enough to do it
measure by measure. Now for step editing, you can scroll foward and backward
easily enough, but is seems to me there are a few unneeded formalities you
must do when changing something.

2) The SMPTE feature

I dont have any multi-track tape records so have not used this feature.

3) Copy Protection (if any, how does it make life difficult?)

The only copy protection is that you must have the SMPTE box plugged in
at all times, therefore it is a hardware oriented protection. You can
copy the software as much as you want, it just wont do you any good
without the SMPTE box. I must say I like this better than worrying about
messing up a key disk.

4) Recommended System Set-Up

At least 1 meg, without that you cannot hold much. Hybrid Arts says
that 520 users should upgrade soon, new features are going to up the
overhead. If your song has a lot of volume controllers, you will need at
least a Meg. But this is probably true with any sequencer.

5) Nifty Features (ie - HybriSwitch, patch ed/lib stuff)

There is an easy interface to Genpatch. Since I dont have Genpatch,
I havent really used it. The idea of it is to be able to do a sysex
automatically when playing a song. Of course it has the track humanizing and
quantization, and you can also do shifts ahead and behind the beat by a
few ticks, so you can put the groove in the pocket or give it a Brooklyn
Beat-*ss feel if you want. As I understand it, the Genpatch interface
is as a desk accessory, and you can access any desk accessory from
inside SMPTE track. There is no way I know of going to something like
DX Heaven or CZ-Droid. Again, I like the graphics interface. The ability

to change tempos and time signatures is straight foward, as well as having blocks of data to follow the repetitions in the form of your music. The filtering capabilities are nice, and you can filter your input source, plus you can filter your individual tracks. It will take me a little more time to decide if they left out some useful global filterations.

6) Approximate Retail Price (where can I get the best deal?)

I got mine for under $400. But I know the Hybrid Arts rep so I got the best possible deal. Check some of the mail order places in Start, etc.

7) Any known bugs, quirks, problems, complaints

I had an 520 ST in which it didnt work with. It turned out to be a bad RS-232 port on my ST. (the SMPTE box plugs into both the extra keyboard port and the RS-232) I traded it in for a MEGA 2 and it worked fine. One thing that I notice is that after I have saved a SONG file, you cannot record past the End-of-Track mark using the punch mode. There are ways to work around it easily of course, and there may be something I am overlooking too. I only have been using this for a couple months, and I really have only put 2 songs on at this point.

I also have not done anything with Dr Ts, so I have nothing to compare it with. I have been on music bulletin boards where most people like the Hybrid Arts and Passport the best. One thing about the Hybrid, it has the reputation of being the best in terms of accuracy of the timings, and for me, that is the most important feature. For one, it has a resolution of 96 ticks per quarter note. There might be some new sequencers from different companies that have more, I dont know. I should warn you, me orientation towards music is more towards improvisation, and I am developing my own software to create improvistions with my MIDI equiped trumpet, so some of the various features on the various models may pass me by. All I can say, it works fine for me, and is a very professional tool for putting music on in which I havent yet exhausted all its features. They will be adding an interface to the MIDI standard file format, but if you really need to know Hybrid Arts format, they will give it to you if you sign non-disclosure agreements. Plus, they have good support on their bulletin board. You can get help from the person who designed the program, and they are very good at that. They have helped me out in designing my own software, so one has to be impressed with that.

4580. TeX font help wanted

Newsgroup: comp.sys.atari.st
Date: 1988-07-12 14:04:00 UTC
From: franco@iuvax.cs.indiana.edu
Message-ID: <36500049@iuvax>
Source record: 251680

I have STTeX from TooLs, GmbH. The package comes
with few fonts so I have had to steal or make my own.
The printer fonts I stole from PCTeX work but they are
too bold. I tried to make my own 240dpi fonts (for
an Epson FX-80) but I get the error message "wrong
aspect ratio" from the driver when it attempts to load
those fonts. It could be that the mode_def I am using
is wrong. Does anyone have a mode_def for FX-80 printers
that produces the beautiful output the printer is capable
of? If so I would appreciate receiving a copy. Thanks.

Please mail to: franco@iuvax.cs.indiana.edu

From: landay@cory.Berkeley.EDU.UUCP
Message-ID: <4441@pasteur.Berkeley.Edu>
Source record: 251684

Could anyone send me System 3.2/Finder 5.4 on a Magic formatted disk
or electronically? I can't seem to find it anywhere.

Thanks

James A. Landay

>Technically there should be no problem.

I believe there is a technical problem, actually. Isn't the cartridge's address bus only 16 bits wide? If so, that places a 64K limit on the size of cartridge software, unless some fancy footwork (a la OSS's SuperCartridges on the 8-bit) is done to increase the effective space. And said footwork isn't trivial, as far as I know. Of course, I'm not a hardware person, so this could be totally bogus.

4587. ST - MEGA ST: Compatibility

Newsgroup: comp.sys.atari.st
Date: 1988-07-13 13:37:38 UTC
From: markhof@exunido.uucp
Message-ID: <439@laura.UUCP>
Source record: 251687

I saw a icone2 programm running on a MEGA ST. I was told that icone runs only on MEGA STs, but it was really nice, so I decided to copy it ignoring the fact that I own an 1040 ST. Because my ST is upgraded to 2 MB, I hoped that icone2 would also run on my computer. But I only got two bombs...

So I'd like to know why some programms run only on one machine type, but not on the other. Further, are there any "compilers" which produce an ST executeable file from a MEGA ST executeable file? Perhaps, there are only some memory addresses to be changed?!

Anyway, I'd like to get an version of icone2 which runs on my 1040 ST.
Is anyone able to help?

Ingolf Markhof.

4588. Corrupted STARTGEM uuencoded binary

stc!@helios.ee.lbl.gov writes:
> It usually fails with an error 36 or 39 - The documentation says
>these are TOS errors although I haven't been able to track them down yet.

Error 39 is "out-of-memory". It is possible that on a 520 you really are running out of memory. Gulam probably uses quite a bit, then the make program uses some more and there's not enough left over for the compile, especially with a RAM disk installed.

Error 36 is "access not possible" I don't know what this means exactly but I think it can happen when TOS is confused, as when it's running low on memory.

The GEMDOS errors are listed in several places:

1) Atari GEMDOS manual (with $300 dev. kit)
2) Book "Atari ST Internals" (around $20)
3) Most good C compiler docs, inc. MWC and Megamax C.
4) Probably other ST programming books

I hope this info helps some.

Ok guys <grin>. There is just *so* much that I can stand my name taken
error. It's JOHN OGAWA <grin>. Of course, the *really* funny thing about
all of this is that all 3 of us, Steve, John, and I, live in Minneapolis,
and are on some of the same BBSs <grin>.

John was right, I was taking a stab in the dark, guessing that MJC
had a call to Perror (or some such routine) built into its TOS call handlers.
But, all's well that ends well.
Er, please DO NOT REPLY TO THIS ACCOUNT. I will never see it. In
fact, until I find a USENET-accessable account, I will never see any replies.
I *am* working on Schizo v1.5, for those who are interested. It is
taking a long time because my research is getting in the way. I will ask
someone to post it here if and when it is completed (maybe by one of the two
kind fellow Minneapoleans above). If I can get it going, it will have a
non-GEM-dependant corner clock, and resolution-sensitive DESKTOP.INF reading
abilities.

Thanks much,

John Ogawa

Message-ID: <19880713203401.7.JRD@MOA.SCRC.Symbolics.COM>
Source record: 251693

After reading all the recent mail about UW on the ST, I decided it sounded like a cool thing, and was worth trying out. I dug up a server (from elsewhere on the net) and put it together. (By the way, it seems to work; if nobody still has source to a working server, I'll pass along what I've got) I then hauled down the UW for ST, only to find out that it doesn't work on a color monitor (!) Does anyone know if there's a mail address for the folk that have been hacking on it? I want to beg/plead/bludgeon them into stopping this fascism and fixing it to work in the general case. Or at least release the sources and let me fix it myself.

Try Publishing Partner for the Atari ST, from Softlogic Solutions(?).
It claims to be able to output a GEM metafile, although I have not yet
tried to use this feature. This is a very powerful, relatively
inexpensive Desktop Publishing package (~$80). It is worth the money.

I am not affiliated with Softlogic.

I think anyone buying a Mega ougth to insist that the dealer run his diagnostics kit in your presence, it individually checks all the chips and reports problems. The first one I got lost its mouse only on a certain menu of the Hybrid Arts SMTPE track, and it turned out to be a bad keyboard chip. Seems like a lot of bugs like that are occuring.

Also make sure about the media change problem, I had the dealer change disks to a 314, which are not the Chinons. Now it works ok.

In light of all the recent reports, this should be done.

Jeff Beer, UUCJEFF@ECNCDC.BITNET

True, the address bus is only 16 bits wide (15, actually, with Upper Data Strobe and Lower Data Strobe providing the High/Low byte info, as well as doubling as the Data Strobe). However, there are two additional lines called "ROM Select 3" and "ROM Select 4" which become active when the addresses 0xFB000-0xFBFFFF and 0xFA0000-0xFAFFFF, respectively, are read. This gives access to 64K bytes x 2 = 128K bytes, just enough for the ROMS, but no room for the clock as in the 64K byte Magic Sac.

4598. MIDI Thru

Newsgroup: comp.sys.atari.st
Date: 1988-07-13 22:35:27 UTC
From: jsd@UMass.BITNET
Message-ID: <880713183142A48.AFUJ@Mars.UCC.UMass.EDU>
Source record: 251698

Hi there. Any of you technically oriented net people into MIDI?
What I'm specifically interested in is making the ST perform a MIDI
Thru function. I half-remember seeing in some magazine that the ST designers
decided to incorporate the MIDI Thru function into the MIDI Out jack.
I have a sequencing program called Master Tracks Pro that has a MIDI
Thru icon. You click it and *poof* - instant Thru jack. It seems to
run all the time - even if the computer is tied up doing disk i/o or
menu handling or what have you, the MIDI data keeps on flowing in real
time. This leads me to believe that maybe there's some sort of system
call or something I could do that would get MIDI flowing. Is this so?
I'd like to write a desk accessory that would just ask for input and
output channels and instantly turn the ST into a THRU box as I like to
diddle with my synths while using other programs, like Uniterm. So, is
this a simple sys call or a complex interrupt driven task? I could
write a dumb loop that just did Bconins and Bconouts to the midi ports
but that would take over the machine completely. Help please! Reply
directly to the address below. I'll summarize responses. Thanks!

Source record: 251699

While we are on the subject of "adding data for those with a statistical bent."--as Dave Flory (I think) puts it.

I own (or at least have in my home) a 1040ST, an IBM clone, an Atari 1200XL, and a Mac Plus. Out of all of them the one I have had the least trouble with are the two Ataris, I have had to have my ST's drive heads alined a few times (that might be due to the fact that I format SS disks as DS). I haven't had any other work done on any of the others. The Mac Plus' OS is buggy. Every-so-often it crashes just when I'm in the middle of something big that I haven't saved for a while. My Mac Plus also dosn't have a reset or restart button, so when I get a system error (which I do often) I have to turn it off. I used to have a Mac 512, and when I upgraded found that the Mac 512 and the Mac plus were not very compatable when all of my favorite software bombed. My ST is my main computer, and I usually only use the Mac for an occasional game, or desktop publishing (because I have access to a laser printer).
I totally ignore my clone, and basically my 1200XL has retired for a games machine. I am very pleased with my ST, and I believe it is the best microcomputer on the market today!

~~~~~~~ As far as Megas go, after hearing about the problems of the Megas, I asked my local Atari service man how many Megas he had in to repaire, he said none.

It isn't just Atari that caused this magazine to fold, there were two other factors.

1. The marketing of the magazine was terrable. It was high priced and packaged so it was unable to read (I refuse to buy a magazine unless I know what I'm getting).

2. The economy is not in as good a shape as the government would have you beleive. Many economists say we are already in a depression, and many buisnesses are closing. Another sign of this was the lack of fireworks displays here in Phoenix Arizona. Although around the country many fireworks displays were cancelled due to drought, the weather here has been normal, and this year there were only about three displays here, and there are usually over fifty! All of the local malls seem to be losing the stores that had resided there for years. Has anyone else noticed a similar trend?

I just felt it necessary to bring this into mind, that not only Atari related businessess are closing.

Drukman) writes:
->Hi there. Any of you technically oriented net people into MIDI?
->What I'm specifically interested in is making the ST perform a MIDI
->Thru function.

there are no (documented) ways of splitting out/thru midi signals. you are
correct in saying the ST's midi out jack contains both out and thru signals.
it is a simple matter to make a "Y" cable seperating out from thru (i made
my own after a quick trip to radio shack). here are the pin outs:

MIDI OUT

pin function
--- -----------------------------------
1 THRU transmit data
2 shield ground (i think case gets grounded as well)
3 THRU return
4 OUT transmit data
5 OUT return

just take 1 to the new jack's pin 4 and 2 to new 5. make sure 2 goes to ground
BOTH jacks.

BTW midi in is:

pin function
--- --------------------------
4 IN receive data
5 IN return

pin 2 (according to IMA) does not need to be grounded (atari HW doc indicates
no grounding as well). not being a h/w person, i don't know what effect
grounding would have.

Hello,

I have an Atari ST and the cpm emulator. It runs cpm 2.2. My question is where can I get software for this? I would like to play with it. Do any of the files at simtel20 in the cpm directory run under cpm 2.2? Is there anywhere else that archives cpm software?

Steve.

Not that it matters much to the discussion, but the noise you hear is not the disk door sliding open but the drive pin slipping into the funny shaped hole in the disk hub. If you look at a 'naked' drive with a disk in it you'll see the disk door is already open.

4610. Recording ST video on VCR

Newsgroup: comp.sys.atari.st
Date: 1988-07-14 07:33:52 UTC
From: dmak@lynx.northeastern.EDU
Message-ID: <memo.38057@lynx.northeastern.edu>
Source record: 251560

A few people have inquired about hooking a VCR to the ST for video production work. I'm not very familiar with that topic, but I do know Antic Publishing/Software has Cyber VCR available for the ST. I don't know excately what it does, how and with what software... But it's title suggests they've successfully created a VCR - ST interface.

I apologize for my posting of this message with nothing useful to say concerning that product. I assume they must have a useful blurb about it in "The Catalog" section of Antic or STart. I do know it is packaged with a simple looking cable. Can't remember details.. but I think it was serial RS-232 like at one end, and 5 pin DIN type (or similar) at the other... Again, very sorry for the sketchy details (at best). I will provide an update later on.

Also available is "Video Titler Design Disk" for CAD-3D 2.0 (Cyber Studio).

-- No affiliation with Antic Publishing/Software.
-- Am affiliated with a Computer store in MA (reason for my shame in not knowing about this product we stock...)

Message-ID: <memo.38061@lynx.northeastern.edu>
Source record: 251561

Does anyone own SHADOW (by Double Click Software, dist. by Antic Software), the background file xfer desk accessory program yet?

I just recently bought it to effectively replace the one offered in Interlink because of problems with that implementation. Shadow is actually usable (in contrast to Interlink with slows the system down and has problems with keyboard buffering). It's fast, reliable, and easy to use.

The problem I have is that for some reason, I can't install it on my autoboot hard drive. When I perform the steps as listed in the manual, and try booting the system, it just goes into an endless series of reboots after the "Shadow initializing..." text comes on.

I believe the problem is in where SHADOW expects to find either DESKTOP.INF or SHADOW.INF (in auto folder). My guess is it always assumes either file would be on drive A. Kind of an inconvienence for me.

Any help from Paul Lee or Micheal Vederman (the developers) would be greatly appreciated!

(I saw their announcement concerning support thru mail, but had difficulty getting their address... as I am fairly new to this world of netting.)

Dave Mak

Again, no affil. w/ Antic/Double Click/the World.

>respectively, are read. This gives access to 64K bytes x 2 = 128K
>bytes, just enough for the ROMS, but no room for the clock as in the
>64K byte Magic Sac.

The clock should not be a problem...Dallas Semiconductor makes a nice little clock that sits under a ROM socket (or a separate 16 pin package for use with systems not using JEDEC 28-pin packages) that sits kinda "phantom" on the address bus and awakens when a specific sequence of addresses comes across the address bus, then passes the time serially across a data line during subsequent reads. So, unless the clock on the Magic Sac is required to be functionally identical to the one on the Mac, a clock is certainly possible, at a fairly low cost.

Incidently, an additional chip is available from the same source that, using a similar setup, can bankswitch up to 16 banks of memory...so a single cartridge could access up to 16 banks of 128k, or 2 megs. Finally, a third chip uses the same addressing scheme to implement a simple serial port (very simple...software clocked, in fact, but probably sufficient to drive a printer)...of course, the bankswitch could probably switch in/out some memory-mapped i/o, like a Zylog SIO chip to drive an AppleTalk port.

At any rate, if you get a chance, take a look in the Dallas Semiconductor data book...they have the most unusual chips in the industry. The company I work for uses their KeyRing Electronic Key for its AutoCAD-related product (only for the European/Far Eastern Versions though). It's probably the least objectionable form of copy-protection available on the market these days.

> Thanks
> .leonard

There is no way to modify the current Magic Sac (version 5.9 or 5.91) to make it work with the 128K ROMs. The 128K ROMs are _VERY_ different from the 64K ROMs, different things have to be done in order to make them work in the ST.

Your correct about Data Pacific, they are not going to be releasing a 128K ROM version of the Magic Sac. There is no agreement with Apple not to do so though. In fact there are no agreements with Apple on anything other than the name, "Mac" is a trademark of Apple, therefore the name couldn't be "Mac Sac".

Dave Small has left Data Pacific so there aren't going to be many new updates from them. The only new version Data Pacific will be releasing is 6.1. It has major improvments to the disk I/O performance. In one test a file copy which took 2 minutes using 5.91 required only 7 seconds using 6.1.

Dave is currently working on improved versions of the software he developed. These improved versions will be marketed by him not by Data Pacific and will do everything you want them to do. (Great vague statement about the new features, unfortunately Dave is out of town so I can't clear anything more specific with him.)

[Some chap from the UK said that Carrier Command was not
the best 3D game around. He mentioned a game called
ZARCH which is available in the UK and runs on the
ACORN ARCHIMEDIES RISC-CPU "I can make the coffee too"
COMPUTER. Read on..]

Gamers who read reviews avidly will no doubt be aware of the existence of a game for the ST called VIRUS. The game features a 3D unfolding landscape, chase baddies all over the place and zap them scenario and is similar, though not identical to ZARCH on the Acorn Archimedies (spelling?). You will not be surprised to learn that VIRUS is a port of ZARCH onto the ST. As far as I know the game has only this month hit the shelves and may not be available outside of the UK yet. (I expect to be corrected on this last point, so don't bother :-))

A similar sort of game, 3D scrolling, exists, at least in the academic community close to INMOS and the UK software houses that specialise in the OCCAM programming language. I think the origin of ZARCH and hence VIRUS lies in a well publicised series of test and demonstration programs that were designed to show off the TRANSPUTER chip's abilities. Has anyone looked to see if the writers of ZARCH, VIRUS and these demonstration programs have any association?

Andrew.

4618. Re: Compute's ST (& magazines in general)

Newsgroup: comp.sys.atari.st

I recently found out that the reason why diskette magazines, like Compute's ST & ST X-Press, are sealed is because *the bookstores want them to do it*. This information comes directly from a reply to a letter which I sent to Rich Decowski, editor of ST X-Press: "And it [the magazine] isn't sealed to try to hide it! It is done so because the book chains WANT it that way. I would rather have it unsealed so that people can see how much information is in each issue." By having the magazine sealed, book stores cut their losses from people stealing the diskette inside the magazine.

From: jparker@watvlsi.waterloo.edu
Message-ID: <3960@watvlsi.waterloo.edu>
Source record: 251569

I have been told that the ST runs as much as 30% slower than 'normal' when used with the Atari monochrome monitor.
I assume this means compared to running the same software using the color monitor.
Does anyone know if this is true, and if it is, why ?

Secondly, I have also heard reports of 68020/68881 boards available for the ST (ie. a series of articles in the German magazine c't) and at the same time, I have been told by several people that at present TOS does not handle the 68020 instruction set (TOS uses instructions for system calls that are now legal 68020 instructions, etc).
So, does this mean that those people using 68020's are running different operating systems...?

Any who can enlighten me on these matters would be greatly appreciated.

James

4621. Hard Disk Problem

Newsgroup: comp.sys.atari.st
Date: 1988-07-14 20:19:08 UTC
From: Jack_Mason@CSC03.CEO.DG.COM
Message-ID: <4.012935@adam.DG.COM>
Source record: 251571

To Brian Park's question on hard disk problems, there could be two issues causing your trouble. One is the 4 Mb partition for drive "D:", since the Atari ST apparently has problems with partitions smaller than 5 Mb. The other could be you are passing the 40 folder limit when you do a 'show info' on partition "E:". A program to fix the 40 folder limit is available on Compuserve under the name "FOLDRXXX.PRG" which is placed in the AUTO folder. I had similar problems that disappeared when these two issues were resolved.

4622. problems with hinstall

Newsgroup: comp.sys.atari.st
Date: 1988-07-14 21:39:53 UTC
From: leo@philmds.UUCP
Message-ID: <561@philmds.UUCP>
Source record: 251572

I'm having trouble running the hard disk driver installation program, hinstall.prg. After selecting Install from the menu-bar and clicking on Yes (Do you really want to etc...) the program bombs (bus error). I've retried after disabling all AUTO *.prg's (except for AHDI.PRG) and all accessories, but the problem remains (so it shouldn't be my fault 8-). ARC.TTP says that all files in the archive are ok. They are:

204BOOT.IMG 204ROOT.IMG AHDI.PRG DIRSLEFT.PRG DIRSLEFT.TOS
FOLDR100.PRG HDX.PRG HDX.RSC HINSTALL.PRG HINSTALL.RSC
SHIP.PRG WINCAP

The first problem was that hinstall.prg could not find a:\hinstall.rsc, so I put all files on a floppy in drive A: and retried it from there. Then the bus error occured. The disk itself is not accessed (a SH204). The system I'm using is a 520ST+ with a SF354 and the hard disk (the roms have at addresses 0xfc001a and further: 1985 0007 0b74). The hard disk has the standard partitioning: 4-6-10. The dirsleft.prg and dirsleft.tos programs worked. Most other programs were the same as on the boot diskette I got with the hard disk (like hdx.prg, hdx.rsc, ahdi.prg; ship.prg and wincap were different though).

What I'm asking is: has anybody successfully installed the bootable driver? or has anybody had the same problems I had? or am I doing something wrong? Give some spec in your answer of the system you're using; preferably e-mail.

If all the installation program does is writing one of 204boot.img, 204root.img (they are the same anyway) onto the first sector of the disk I can do it myself with a little program.

Any help appreciated.

Leo.

4626. need a fast (9600) vt100 emulator.

Newsgroup: comp.sys.atari.st
Date: 1988-07-15 05:21:29 UTC
From: morris@dms.UUCP
Message-ID: <453@dms.UUCP>
Source record: 251576

I need recommendations for a fast vt100 emulator on the st.
It has to be able to keep up with data coming in at 9600 baud.

I have tried AnsiTerm, and Flash so far, and they seem to be
around 2400 Baud.

I believe the problem is the screen update rate. These programs will
allow you to talk to the port at 9600 (Even 19200), but the time they
take to write to the screen slows them down to about 2400.

So anyone out there know of one??

Thanks.

PS I am not affiliated at all with the atari that builds the ST.
Atari Games is THE ORIGINAL Atari! COIN-OP division! :-)

" >
" >Has anyone had problems with programs 'losing the mouse pointer' on Mega 2
" >machines? [detailed description of problem deleted]
"
" I've seen this problem on my Mega, but I thought it was a bug in the
" application, not in the ROM. On my machine, it happens when I
" accidentally drop a menu while the screen is being updated. My
" assumption that it was the application's fault was based on the fact
" that menus shouldn't drop while you update the screen, since one should
" "brace" the update code with a call that tells AES that you are changing
" the screen contents (I don't remember the function's name).
"
"
" --
" Federico Heinz "In Dubio Pro Libido"

The problem does not only exist on the Mega. My 1040 has also exhibited
the disappearing pointer syndrome while running Uniterm, WordPerfect, VIP
Professional and other programs. As Federico stated, it happens if I drop
a menu while the screen is updating. Moving off of the menu and clicking
once will bring the pointer out of hiding.

I am not sure whether the fault lies in the application or the AES.
I haven't yet tried to lose the pointer on purpose, but it seens to have
happened with every program that does extensive screen updating.

Get Uniterm. It is, without a doubt, the best communications program
available for any computer anywhere at any price, and it's free. It'll
do vt220 at 9600bps, no sweat, no XOFFs, no problem. In addition to all
the file transfer protocols, you get the most comprehensive suite of
terminal emulations I've ever seen. The macro processor is pretty slick,
with some very nice functions. I can't say enough good things about this
program. I love it. It's so convenient to use, and does so much, so well.

By the way, the author, Simon Poole, is "around" on the net, and can
probably be reached directly if you have any specific questions. I
s'pose I could disclaim any relation to Simon or Uniterm, other than
that of enthusiastic user, but it doesn't really matter since it's not
a commercial product being distributed for any fees. Anyway... Get it.
Nothing else is even worth considering.

I don't mind a small amount of constructive? criticism,but all you seem to be interested in doing is telling people when "you think personally" that they are wrong.
As far as a game as oblitorator is concerned,I personally don't like it but I know several people who think it is "brilliant".
Let's now talk about Carrier Command now.We don't all have very much money which is reason for buying an Atari ST and not an overprised (my personal opinion) Archimedes) which is really only a glorified BBC micro.Put simply let's wait until "Abaq" is released and then I can say that all (yes I mean all) Archimedes games are crap in comparison.After all I don't compare the old 8-bit Atari with the Amiga,or the spectrum with the ST.In all honesty there are a lot of games on the market that I don'like ,and that is my prerogative right,but apart from instances like now I don't annoy people by saying that they are catagorically wrong in there own Opinions,because my opinion is mine,and your opinion is yours.

4633. Fontz for WordUp

Newsgroup: comp.sys.atari.st
Date: 1988-07-16 05:05:00 UTC
From: Friesen@HIS-PHOENIX-MULTICS.ARPA
Message-ID: <880716050527.890926@HIS-PHOENIX-MULTICS.ARPA>
Source record: 251583

I am thinking of purchasing Wordup, and am curious about an extra package for it called Fontz. It comes wiht a few fonts, a font designer, and a program that allows you to change Macwrite fonts to WordUp fonts. This feature is very handy, because I have Macwrite fonts bursting out all over my Mac (they always make it low on memory). I would like to know, however, how one would go about changing the fonts over, after all ST and Mac disks are not compatable.

Has anyone used the package?

Thanks in advance

From: BHOLMES@WAYNEST1.BITNET
Message-ID: <8807161829.AA02026@ucbvax.Berkeley.EDU>
Source record: 251584

Since my last message, I have received several replies, but I still have not been able to get UNITERM V2.0d 005 to transfer files via KERMIT to VM/CMS. I have no problems with FLASH, PROCOMM, MS-KERMIT, or MAC-KERMIT. I set flow control to none, and log on VM/CMS with 7 bits EVEN parity. FLASH doesn't even have an option for flow control and it works. When I work with PROCOMM, FLASH, MS-KERMIT, and MAC-KERMIT, a strange character appears at the beginning of each line, when I have flow control disabled. When in UNITERM I don't get this extra character. How can I be sure that flow control is disabled? Has anyone been successful with a UNITERM - VM/CMS kermit file transfer?

4635. re: SMPTEtrack!

Newsgroup: comp.sys.atari.st
Date: 1988-07-16 18:18:34 UTC
From: Updike@UMass.BITNET
Message-ID: <88071614060017E.AHJE@Mars.UCC.UMass.EDU>
Source record: 251585

I'm not crazy about the program. The editing features are not that great, and I don't like the interface.

I'm using Master Tracks Pro and like it very much except for the slowness of GEM windows. It's good features include:
1. 192 ppq
2. MIDI file standard support
3. Nice editing
4. System exclusive recording
5. The ability to map the MIDI keyboard so that you can control the transport controls of the sequencer from the MIDI keyboard.

It's a nice program. It does not come with SMPTE. For my money, however I would rather have MTP and a Jambox2, which provides extra MIDI outs, a MIDI merging function and read/write SMPTE in all three formats. In addition, Jambox2 will work with most Sequencers....so you can bring it with you into the studio and have it work with your Yamaha QX7 or with anything that supports MIDI song pointer.....The cost will be about $500 for the whole set up and provides much more flexability (I think). MTP is copy protected, allowing you to make as many backups as you need, but you must insert the key disk or main disk at the beginning of each session. Not great,...but not that bad.

Intelligent Music is coming out with a program called Realtime for the ST which will be the ST version of Upbeat (from what I have heard) which allows real time loop recording....something that no sequencer program on the market allows...for those of us who love drum machince programming. It will support MIDI file standard and be basically like Page R sequencing on a Fairlight. They also have a version of M out for the ST, but I don't like programs which know more about music than I do.

On the question side: Does anyone know if Turbo ST will speed up GEM windows like it claims? This would help a great deal with the slowness of the GEM windows in MTP.

Do the new ROMs allow you to boot a GEM program from the auto folder, or will we have to continue using STARTGEM?

Any information would be helpful on these questions.....

4636. Re: SCSI harddisk connection, how?

Newsgroup: comp.sys.atari.st
Date: 1988-07-16 19:21:50 UTC
From: braner@batcomputer.tn.cornell.edu
Message-ID: <5536@batcomputer.tn.cornell.edu>
Source record: 251586

[]

Here is what I think I know about connecting hard disks to the ST.
Anybody with more definite data please comment!

One can get an adaptor card that turns the Atari DMA port into a
SCSI port (or a sufficient subset of SCSI?), from several sources,
including Berkeley Micro Systems and Atari themselves (as a
replacement part for the Atari HD system?). The latter is cheaper
($50 ?) but the BMS (> $100) comes with helpful instructions.

Besides the adaptor card you'll need a cable to connect to the ST.
The Atari card has a 19-pin D-type connector right on it, you'll
need a shielded cable that is rather short (18 inches?).
The card also needs 5V supply.

That done, you can directly connect a standard SCSI drive. The Atari
card fits a 50-pin (?) edge connector. If your SCSI drive is in a box
with external type connectors you'll need an adaptor, otherwise a flat
ribbon cable is fine. The flat cable in the Atari drive is about
8 inches long.

The smallest package can be achieved by buying a spanking new 3.5"
drive that has SCSI built right into it. The Seagate drives with
an 'N' suffix are like that. Search "Computer Shopper" and other
mags for a good deal. You'll also need a box and power supply
(5V and 12V, about 2 amps each). These small drives don't need
a fan. Make air holes in the box.

A cheaper setup can be made by buying a SCSI<-->ST506 controller
(about $90 in the mags, slightly more from BMS). (You can also
get fancy adaptors that can control moe than one drive, tape
drives, etc.) You can also get a SCSI<-->RLL controller, if you
want to plug in an RLL drive (e.g., the 30 Meg Seagate ST238).
If you get the standard kind, make sure you don't get an RLL
drive. Standard drives include the Seagate ST212 (10 megs, real
cheap), ST225 (20 megs, $200), ST251 (40 megs, $350, much faster
than the ST225), etc. Get a half-height drive for smaller
space and power requirements. All the drives above are 1/2 hgt.
Many other brands exist, Seagate has a good reputation.

You can also choose a 3.5" drive with the standard (non-SCSI)
interface. They sport high speed (~30 millisecs), low power,
and automatic head parking. But one of those plus the SCSI
controller cost, together, more than a drive with built-in SCSI.

Supposedly, all the standard drives have identical connectors.
You should look for ready-made cables.

Once you have the hardware connected, you need software. Supra
has a nice set of programs for using, booting, examining, etc.
They sell it separately from their drives, for $25. (Where ?)
There are others.

Hope this helps.

- Moshe Braner

ME? I bought an Atari SH204 on sale ($500), it lasted 7 months
and then the drive mech died for no apparent reason. I'm still
undecided on how to fix it, and wish I went homebrew right from
the start.

>[deleted]
>>Technically there should be no problem.
>
>I believe there is a technical problem, actually. Isn't the cartridge's
>address bus only 16 bits wide?

The cartridge port gives you 128 KBytes of adress space, this is not the problem.

The problem is, the ROM software cannot run at the adress of the cartridge port. Magic Sac and Aladin (the german MAC-Emulator) load the ROM image into RAM, relocate and patch it (in case of Aladin) to acces the ST hardware rather than the MAC ports, floppy etc, and then run Mac software.

Copying the ROMs into RAM ist what Apple Germany calls "illeagal duplication of copyrighted works"; that's why the Aladin must not be sold anymore to avoid legal action from Apple.
besides: I like it very much. It seems more stable than the Sac; too good? :-)

This is true enough (usually), but if the design is bad, the result might be a state you do not want - such as read/write flipflops being in the "write" state. NOTE: I don't say this happens, and it would be pretty bad design if it did, but it IS possible.

>hard disk or a 5.25 floppy, the rw heads are removed from the media by

>that there is a pause of about a second before the disk door slides
>open.

Not on any 3.5" diskette drive I've ever seen. The shutter opens when you put the diskette into the drive. The mechanism is purely mechanical, and has nothing to do with the power. Similarly, a 5.25" drive might possibly have a solenoid to lift the heads when power is removed, but most drives either do not (the heads are in contact with the media whenever the disk is fully inserted and the lever thrown) or have had the solenoid disabled - the "clack-clack-clack" of the solenoid is generally enough to drive you batty real quickly.

What sort of drives do you have, that you can hear this delay?

>In summary, by the time the rw heads get to the point where they could
>do damage, the control circuitry has long since settled down. If
>there are problems, this reflects either a design error in the hard_
>and or software, or a transient glitch.

Hmm. "Transient glitch". Like, the transient glitches that you get all through your system when the power comes up or goes down? You do as you will. I'll continue to take the diskettes out before I power up or down, thank you.

>Ok, now we know it is possable, but could some kind soul tell us how.

I'll try.

I did it. It's not that hard if you have a RAM board you can access like static RAM (a SRAM board or a DRAM board with local refreshing circurit).
Just connect that to the adress and data bus, and provide DTACK to the DTACK line, so the GLUE chip will not issue a BUSERR.

The tricky bit is the software. GEMDOS can use 4 MB, not more. The cusrom chips are the same, they can't use the RAM behind 400000 Hex (right, Atari?). A patched OS/9 works just fine.

Source record: 251592
Cross-posted to: rec.music.synth,comp.sys.atari.st

(I don't believe in the line eater, I don't!!!)

OK, I have a 1040ST Color system and a Yamaha DX11 synthesizer. I am interested in getting s decent patch editor/librarian PD - or cheap. I currently have been using a program called TXLIB2 which is a share-ware product written for the TX81Z. It will transfer patches *to* the DX11 fine, and even edit patches *in* the DX11 fine, but when I try to sedn patches *to* the computer I just get the first one or two patches correct and the rest of the 32 are all garbage. I know some friends with TX modules for whom the program works fine *both* ways. I have tried the System Exclusive feature of Michtron's SuperConductor MIDI sequencing program and get it to receive the patch info from the DX11, but when I try to send it back to the DX11 I get a 'MIDI CSUM Error' which tells me that some type of handshaking was missing.

Any help on this would be greatly appreciated. I do plan on getting Hybrid Arts SmpteTrack soon and a decent librarian/editor, but the cash is scarce and the wolves are at the door - so a temporary solution would be great!!!

Thanx....

Rick Random - 'He's Our Man, if anyone can do it - He Can!'

> I talked with Data Pacific a few days ago, and they said that they
> were working on several things, two of them were...
> 1) Making Magic Sac work with 128K ROMs. They said that this was
> still in the development stages.
> 2) A five fold speed up for the Transaltor One. This was currently
> in beta test.

Data Pacific is not working on a 128K ROM version of the Magic Sac. Dave Small is working on one but not for Data Pacific. Data Pacific's management has not accepted the fact that Dave (and I for that matter) have left and are not coming back. They still believe that we are going to return bringing great and wonderful new programs with us, so they refer to Dave and my new work as their own.

There is a new version of the Magic Sac that improves disk performance. Version 6.1 increases disk I/O by up to a factor of 10 on Magic format floppies and on hard disks. Unfortunately there is no change in the performance of the Translator One since it is limited by the bandwidth of the MIDI ports not by software.

>my fault 8-). ARC.TTP says that all files in the archive are ok.

I use hdb version 2.3 with no problems at all. In my opinion this is a better program than atari's hinstall because you can make any partition on the disk bootable, not just the C partition. Like hinstall you can disable harddisk booting by holding down shift control and alternate. Furthermore hdb can be deinstalled quite easily. The only required is a copy of ahdi.prg in the root directory of the disk you wish to boot from (hbd installs a 'read only' disk driver on the bootsector of the boot volume which reads the "real" ahdi).

If you want I can upload it to the net; I've thrown away the docs, since installing is dead easy.

4652. Networking STs together...Help Wanted!

Newsgroup: comp.sys.atari.st
Date: 1988-07-18 21:52:47 UTC
From: keithr@vice.ICO.TEK.COM
Message-ID: <2688@vice.ICO.TEK.COM>
Source record: 251602

I am trying to find out if there is any company that has networking hardware available for the ST. What I want to do is connect 3 1040 STs together in an office environment with one ST as the "master" which has a 20 meg hard drive. I would like to be able to transfer files back and forth from this "master." The cable distance between the 3 systems would be a maximum of 60 feet.

Can anyone help? I've heard whispers and rumors, but no one knows who, when, or how much. Any help would be greatly appreciated.

Keith

One of our German customers has IDRIS OS (our product) running on this 68020 board. As he tells me, that you also need the new/patched TOS ROMS which the manufacturer also supplies.

He sent us the schematics for this board and our hardware engineer says it is pretty straight forward. They also sell a memory card for this 020 card.

NOTE : the fact that our customer has IDRIS running on the 020 card, does not mean that we officially support it. We would officially support this card after testing it (we do not have one yet).

Sincerely

Source record: 251604

I want to thank those who replied to my SOS on the hard disk problem I was having with my Supra Drive 20Meg. It basically came down to that nasty 40 folder limit. Perhaps most of you know this, but I was under the impression that the limit only referred to the number of folders one could keep on a particular level; I did not realize that it also applied to the number of folders one could *look* into during a session. Well, having a little over 100 folders altogether on my three partitions, I was just asking for it.

The solution was of course FOLDRXXX.PRG. (Thanks to Hugh Redelmeier who sent it over to me.) This program should be used by everyone with a hard disk! In fact, if you use the recently posted FATSPEED.PRG (speeds up your hard disk fat table access) then you *must* use foldrxxx. Otherwise, you will certainly start wiping out files on your hard disk. Take it from a person who is weeping over five of them.

On Jack Mason's point that perhaps my D: partition, at 4 Megs, may be too small, I have not noticed anything extra-ordinary yet.

Oh, one last thing. Due to an error an my part, my original article would not have reach anyone outside North America. This followup, however, contains enough to compensate. I have now absolutely no complaints about my Supra Drive, except for that rather loud hum (but that's another story). Thanks everyone.

>still in the development stages.

Not true! I just had dinner with Dave Small (Creator of Magic Sac), who
doesn't work for Data Pacific anymore and he said that he is working on
the 128K ROM version and that it should be ready around Christmas. But it
won't be marketed by Data Pacific but rather by his new company 'Gadgets Inc.'
He is giving this project TOP priority and I, for one, am looking forward to
it with great anticipation.

Mike

I just heard the terrible news that Tom Hudson is leaving the ST to go to the IBM! I have only one thing to say about this:

TOM! PLEASE DON'T LEAVE US! I'm sure all of you will agree with me that Tom Hudson has done more for the Graphics capabilities of the ST than any other single person and that such a loss would be disasterous to the ST communitity. I hope that Tom will change his mind or at least support the ST as well as the IBM.

And that's the opinion of one concerned Atari ST citizen...

I have called them (Tech Specialties) about their kit, and the price they gabve me was $299 not $269, hmm, I like your price better. Be advised that the kit that you are describing is an MFM controller, for an RLL controller, add $80. Still a real good price though. Could you post the name/place where you are getting such a good price on the Seagate 42 meg 28ns drive?

>Last night (at 3AM) I accidently copied a file over itself.
>This seems to trash the file rather than touching the date
>or doing nothing. Will this be fixed in the new ROM version? (Atari?)

Tried it with a 14K file (i.e. copying from the Desktop), but the
contents remained the same. The date was changed.
Then I tried it with a simple copy program, like this:

```
#include <stdio.h>
#include <fcntl.h>
#include <osbind.h>

main()
{
int fdi, fdo, nread;
char buf[BUFSIZ];

fdi = Fopen("test.dat",O_RDONLY);
fdo = Fopen("test.dat",O_WRONLY|O_CREAT|O_TRUNC);

while ((nread = Fread(fdi,BUFSIZ,buf)) > 0) {
Fwrite(fdo,nread,buf);
}
Fclose(fdi);
Fclose(fdo);
}
```

Odd enough, even though O_TRUNC was specified the contents remained the
same (in Unix you would get an empty file). Also the date was not changed.
Interchanging the Fopen calls didn't make any difference.
So the next question is perhaps: what ROM version are you using now?

Leo.

B.T.W. What in the world made the GEMDOS writers decide to swap the
second and third parameter in the Fread and Fwrite calls, compared with
Unix read() and write() ? Since they 'leant' quite a few things from Unix,
wouldn't it have been easier to use the same parameter ordering?

I would like to see one of these mythical Archimedes machines. I know
plenty of people who have PCs, Macs, STs, Amigas but I have yet to
meet someone who has one of beasts. Are they restricted to England?
Are we going to have a 'my Archimedes can beat your st with half a
meg tied behind its back' wars?

BTW: I got my Publishing Partner Professional update last week and
eagarly booted it up. It looked really sharp, I start to work, and
2 bombs, 3 bombs, 4 bombs, more. What a disappointment. They say
in an enclosed letter that they know of most of the bugs and are
working on them. I guess we will have to wait for the upgrade to
the upgrade. SIGH...

> Thanks very much,
>
> Arnie Elkins

Well, there's always the MKB (Monkey with KeyBoard :-) un-shell-archiver.
Sit down with your favorite text editor and split the shell archive by hand.

For all the shell archives I've seen, it shouldn't be difficult, just a mite
bit tedious. If you know Un*x, you'll readily see what the 'cat's and 'sed's
were supposed to do. Even if you don't, looking at the file and a little
meditation should lead to a train of thought along the following lines:
"Hmm... this seems to want to make a file called 'Foo.c'... yeah, this looks
like C code, but there's an X stuck on the front of each line... well, if
I copy the file to 'Foo.c', delete all the lines from the beginning to HERE
and from THERE to the end, and then delete all those leading X's...
yeah, that should do it..."

The whole point is that sometimes we get too tied down to having the computer
do all our work for us. (Ever hunt for your calculator just to add two 2-digit
numbers? I know I have.) Just because something could be done easier and
faster on a computer, it doesn't mean that it CAN'T be done WITHOUT one.

I hope you find a un-shell-archiver, they're nice things. (I believe one may
have been posted to comp.sources.unix a while back, but that just leads you
back to the original problem, plus the work of porting it.) But if the
shell archive contains something you'd really like to have a look at,
you might want to consider spending half an hour with an editor splitting
it manually instead of waiting a week or more to get an un-archiver to
get the computer to split it for you. Either way, good luck.

4665. More Gulam problems

Newsgroup: comp.sys.atari.st
Date: 1988-07-19 19:33:00 UTC
From: jrd@STONY-BROOK.SCRC.SYMBOLICS.COM
Message-ID: <19880719193319.2.JRD@MOA.SCRC.Symbolics.COM>
Source record: 251615

I recently discovered why my ARC was behaving so strangely. When I tell gulam "arc a foo *.c" gulam attempts to expand the "*.c" into "foo.c bar.c baz.c ...", and substitute that list of file names into the arglist before starting up ARC. the problem, of course, is that if you've got very may files, gulam comes up with a ridiculously long arglist, and ends up trying to call ARC with a bogus argstring, or otherwise getting confused.

Checking the GULAM doc reveals some stuff about how it's a feechur (as opposed to a bug in a tux) that it attempts to outsmart itself this way, but I couldn't find any way to disable the feechur. Does anyone know if it's possible?

Gee anybody who has been involved with the ST probably could have
told you that was gonna happen. Doesn't it make you wonder how they
ever managed to design build and ship the original ST in the short
time that they supposedly did! ;^)
I know I can't wait to replace the OS with minix, and forget about
atari and all their blowing off at the mouth. If you need convincing
that atari doesn't support the machine, go read the preliminary review
done by Byte magazine of the 1040. I believe it was the March issue
of 1986. Especially note the interview with their engineer Shirav
Shivji (sp??), and all the stuff they were gonna have that has never
shown it's face. I bought my machine based on that article, instead
of an Amiga, and it is one of the biggest mistakes I ever made.

The GemDos Fopen call has no flag O_TRUNC. Sometimes GemDos is way off the
Unix standard. (certainly in speed). In order to mimic the O_TRUNC you
should have your own open call, something like this:
```

```
open ( name, mode )
char *name;
int mode;
{
int fd;
struct statbuf statbuf;

if ( mode & O_TRUNC ) {
if ( stat ( name, &statbuf ) == 0 ) {
if ( statbuf.attr & (F_VOLUME|F_DIR|F_READONLY) ) {
errno = EACCDN;
return ( OPENERR );
}
if ( unlink ( name ) < 0 )
return ( OPENERR );
mode |= O_CREAT;
}
}

fd = Fopen ( name, mode & 3 );
if ( fd < -3 && ( mode & O_CREAT ) ) /* try to create the file */
fd = Fcreate ( name, 0 );

if ( fd >= 0 && ( mode & O_APPEND ) ) /* seek to EOF */
Fseek ( 0L, fd, 2 );

if ( fd < -3 ) {
errno = fd;
return ( OPENERR );
}
return ( fd );
}
```

Also notice the nice effect of writing to a 1024 byte long file with read and write access on byte 24 for example. The file will remain 1024 bytes long!

4668. software for theatre work?

Newsgroup: comp.sys.atari.st
Date: 1988-07-19 23:34:00 UTC
From: FORSTER@cs.umass.EDU
Message-ID: <8807202357.AA00978@ucbvax.berkeley.edu>
Source record: 251618

Does anyone out there know of theatre software which runs on IBM-PC's, Apple][e's, Atari ST's, Mac's, or Amiga's? (Sorry for the broad cross-posting, but it seems there's no net news group specifically set up for things theatrical.)

A friend of mine does set design, and remarked that no program seems to have been written with a set designer in mind. We got to talking about it, and decided that choreography could be also made easier with a computer (instead of having the whole cast out on stage running up and down doing variations of a number). It strikes me that both could be helped a little by a good drawing package which allowed the use of different perspectives and of animation, but I imagine someone who does more theatre work would find a need for facilities I haven't thought of.

So, to sum up, does anyone out there know what's available for theatre work, particularly set design and choreography, but also lighting, or anything else you can think of.

Please send replies directly to me, as I don't subscribe to all of these digests.

Thanks in advance, David

PC/InterComm will do the job ! It's a very nice program and it works superb.
A friend of me has it run on his ST as a system console at 9600 bps for his
UNIX system.
He has never has any problems with it.

I am using the US TOS ROM that is the one available prior to the Megas
(it is probably 1.5 years old)

I just tried it again. I first booted with a disk that had no auto
folder or desk accessories. I then copied the file (an 18K text file, a
1K file seemed to work fine) to the same directory. Got the message
file already exists give new copy name (or whatever it says.) Left it the
same. Copied the file. Looked at it. It is a repeat of the first 20
lines or so, over and over.

What the hell is this? Does anyone have a program that will return my
ROM identification so that we know which ROMs have it?

By the way, why does deleteting files take so long compared to MeSsyDOS.

THANKS,

hanks
James

4672. Re: Upgrading over 4 megs

Newsgroup: comp.sys.atari.st
Date: 1988-07-20 10:29:06 UTC
From: ralph@lasso.UUCP
Message-ID: <8807201029.AA04993@inria.inria.fr>
Source record: 251622

What a coincidence, but I just read a magazine article which discussed this subject. I am *also* not a hardware buff so I also would appreciate comments on the subject, in general, and on my article, in particular. The article appeared in the French microcomputer magazine "Micro Systemes", July-August 1988 issue. The article described the theory of accessing more memory on a 1040 ST and then showed a printed-circuit diagram of a circuit that they called "Super Glue" which would override the "Glue" chip in the 11.5 Megs available over the 4 meg limit. In fact, the circuit adapts the ST to an external G96 bus on which, I suppose, the memory should be connected; there is *no* memory on the card, just a couple of buffers and 3 PALs. They mentioned that certain parts of the installation were quite delicate. In fact, when everything was assembled they seemed to imply that the result would probably not fit back into the ST case; they suggested buying another case.

I would appreciate any knowledgeable information on this subject. Has anyone read this article? (I don't know how hard it is to get in the U.S.) As always, I still (sigh!) don't get the newsgroups, just info-atari16, so please reply directly to me. Thanx.

You do not have to reply before going on vacation -- so have fun first.

4673. Expanding a 1040 ST to 4 megs

Newsgroup: comp.sys.atari.st
Date: 1988-07-20 10:58:10 UTC
From: ralph@lasso.UUCP
Message-ID: <8807201058.AA05486@inria.inria.fr>
Source record: 251623

I would like to expand my 1040 ST to 4 megs and I rememeber vaguely this subject being discussed in info-atari16. I am interested to know what boards are on the market, who makes them, any problems that people have had with the boards. Success stories are also of interest. Any pointers to distributors in France or Europe would be appreciated.

Since the price of memory has gone up and my ST is personal, I would like to add memory incrementally, starting at 2 megs but surely (maybe that's too strong) going to 4. I remember that there was a discussion on partially filled cards working but that they had problems when filled completely to 4 megs. This point interests me strongly.

As always, reply directly to me (since I don't get the newsgroups) and if there's sufficient interest I'll summarize to the net.

Thanks to all.

The version 1.03.04.05 from lakesys is indeed the latest.
Unfortunately, the "version" files on PM's two machines were out of sync.
It is not a recall.

4678. PD MAKE UTILITY

Newsgroup: comp.sys.atari.st
Date: 1988-07-20 18:52:02 UTC
From: Jack_Mason@CSC03.CEO.DG.COM
Message-ID: <26.013156@adam.DG.COM>
Source record: 251628

Re: Paul Merriman's request for a PD Make utility, there was one on Compuserve. I had a copy of it, but deleted it when I got MWC and Lazer C because they both have built in Make facilities.
In response to earlier questions from someone, both MWC 3.0 and Lazer C have removed the 65k size restriction on module sizes and array dimensions (both were holdovers from the IBM PC segmented memory mentality, one via the Mac).

4679. RE: Uniterm & KERMIT on VM/CMS

Newsgroup: comp.sys.atari.st
Date: 1988-07-20 20:32:00 UTC
From: REEVES@SLACSLD.BITNET
Message-ID: <8807202033.AA06862@ucbvax.Berkeley.EDU>
Source record: 251629

Here at SLAC, we have an IBM 3081. There is an IBM Series/1 that performs the translation from IBM 3xxx terminal to more standard ASCII terminals. This means that when I am running KERMIT, I am in full screen mode. I have little or no problems with downloading files to my ST. I find it almost impossible to upload a file to the mainframe. The settings that I use are the defaults that come with Uniterm, I think. My problem seems to be that the beginning ctrl-A is being lost by somebody along the way. I don't think the problem is with Uniterm since I have used Kermit to send files to IBM PC's that are owned by friends. My problems appear to be located in the interplay of the Micom digital switch that I dial, the Series/1 connected between the Micom switch adns the mainframe, and the mainframe itself. There also may be a problem with noisy connections.

By the way, there is a Vax here with Kermit-32. With it, I am able to download with no problem, and upload with about 50% success. Does anyone out there have almost 100% success with Kermit-32? If so, I would like to know how you do it. At least then, I could begin to try to trace down my Kermit problems.

this is NOT a bug...this is the way gulam is s'posed to work (as does
sh and csh under unix). gulam expands any file wildcards (or more properly
regular expressions) before doing its system(3) call (or Pexec). if you
want arc to read the * in the command line, you must quote it thusly:

arc a foo '*.c'

->Checking the GULAM doc reveals some stuff about how it's a feechur (as
->opposed to a bug in a tux) that it attempts to outsmart itself this way,
->but I couldn't find any way to disable the feechur. Does anyone know if
->it's possible?

no, it didn't out smart itself, you just did not understand how the shell
works. just remember to quote and you should be alright. (ain't Unix
wunnerful for new users? :^). the unix csh has a global variable called
'noglob' which inhibits this action. i don't think gulam has it so you
manually disable it with quotes.

>Does anyone know if this is true, and if it is, why ?

Hmm, ja. It's true: the VBLANK interrupt comes with 71 Hz instead of 60
HZ (or 50 Hz here in Germany..)
That could slow him down a bit (but not 30%!). I see no speedup with the
color monitor (subjective), but I do my work on mono and play on color
:-)

>
>Secondly, I have also heard reports of 68020/68881 boards available for
>the ST (ie. a series of articles in the German magazine c't) and at the
>same time, I have been told by several people that at present TOS does
>not handle the 68020 instruction set (TOS uses instructions for system

Ja. Tos runs into trouble with the stack format, with Line-F (the
floating point instructions) and so on.

>calls that are now legal 68020 instructions, etc).
>So, does this mean that those people using 68020's are running different
>operating systems...?

If you really want to *use* the 881 (and 020), You'll need RTOS/PEARL or
the like.
We use RTOS for realtime applications (train controlling, controlling a
[simulated] nuclear power plant) and I like the speed of the 020.

The c't also published a patch and a modified TOS to run with the PAK68.
The Line-F's are converted to (not used) Line-A's. 90% of all software
runs under this TOS; the 10% *You* like will probably never run (Murphy
:-)...
I had a PAK68 and the modified TOS installed in my home ST. The speed
was not soooo impressive ('cause the 020 can only run with 8 MHz in the
ST).
Another, cheaper modification will do almost the same: replace the 68000
with a socket. Put a board with a 12 MHz type, a new set of ROMs (not
patched but faster; -OE used instead of -CE) and a little, fast adress
decoder (fast DTACK on ROM access) into the socket.
A very friend of mine is working on the little details about it. For
now, it works *sometimes*. The fallback to 8 MHz on VPA (I/O access)
seems to cause the trouble...

summary: the $500+ "patch" with a 020/881(or 882 :-) and new ROM set is
very useful with the german RTOS-UH (RealTime Operating System der
Universitaet Hannover); it is not worth the money+trouble (hacking the
hardware, new case, compatibility, still not impressive fast) for TOS.

>ut-sally!usl!usl-pc!jpdres13 |-----/|-------/|----------------------
>GEnie: J.JOUBERT | \/ \/
>--

I cancelled my order with Tech Specialties after he couldn't deliver the
promised product for 6 weeks after the date I ordered unless I was willing
to pay $40 more (apparently he is using the old Atari adaptor boards and
he ran out (I was told by someone else that those boards have a bug))

I ended up buying from Berkeley Microsystems (415) 465-6956 for $325
(including a clock, fan, large box (holds 4 half heights), power supply,
cables, and software.) I bought the drive from Computer Terminal
in New York (800)-223-4492. Their regular price is $435 but I told the
guy that I had seen it for $410 from another mail order and he was willing
to beat it. (for $399 + shipping.) They made a mistake, (thought I
send a personal check when it was a certified check) so that it didn't
get shipped until today. (they paid for the difference between ground and
next day air). I should have it on friday and I will try it out, if anyone
has any questions send mail. (if there is enough response I will post)

By the way, Vance, at Berkeley Microsystems was very helpful. He even
came to the office on Saturday for me so that I could pick it up rather than
have it shipped.

That was one I posted (18 months ago?) and recently George Woodside posted an updated version for the the Atari (to the binaries? newsgroup). It handles macros quite a bit better than the MWC make (I don't have Lazer, so I can't compare it), but it is not so well integerated into the shell -- reasonably. It's main advantage is that it comes distributed in source, so you can "fix" it when you want to, and it seems to be improving at a faster rate (several netters are making improvements it seems).

>
> I have a Mega St 2 under warranty. How do I check for the disk drive
> "medium change bug"?

Take a WRITE-ENABLED disk (one with the little window closed). Put it into the disk drive, and open a directory window on it. Then, remove it and put it back in, and hit the ESCape key to force a window update. Watch the disk light when you hit ESCape. If the light comes on, and the disk spins (which you might be able to hear) then you are OK. If the light does not come on, you've got the bug.

Or, use two WRITE ENABLED disks: Put one in and open the window. Swap them and hit ESCape, and see if the window changes to reflect the contents of the new disk. If the window doesn't change, you've got the bug.

The bug DOES NOT show up with WRITE PROTECTED disks, so you've got to test using WRITE ENABLED ones.

Since there may be timing issues involved, I'd suggest doing the test about half dozen times, and if it fails on any single try, I'd assume the drive needs modified. Do note also that it is important that you leave the directory window open on your secreen and force the update with ESCape. GEM appears to ALWAYS spin the disk if you close the dir window and reopen it.

The Archimedes really does exist, in two forms the 300 series and the
440 (we're still waiting for the 410 - thats a 440 with 1MB and no
hard disk). The 300's have been available from Acorn dealers in the
UK since September '87.

> ..... Are they restricted to England?

As far as I know, yes. A few machines might have slipped out of the
country by some back door but I don't believe that Acorn is shipping
overseas. They got badly stung when they last tried to enter the U.S.
market, so they're probably a bit wary of trying it again !

> Are we going to have a 'my Archimedes can beat your st with half a
> meg tied behind its back' wars?

Probably ! The Archimedes is the better machine, more colours on screen,
higher resolutions, sound is about Amiga quality and its very fast !
Acorn have a PC emulator (like PC Ditto) but it runs at about the speed
of a standard 4.77Mhz PC (I seem to remember the authors of the program
being reported as saying that it wasn't particulary well optimised !).

The big drawbacks are:

i) Price - twice the cost in the UK of the equivalent ST/Amiga.
Acorn have a bad habit of perceiving their products as "Rolls Royces"
and pricing them appropriately.

ii) Software - limited market penetration = limited support. About Five word processors, a couple of spreadsheets, three games, all the languages available are from Acorn (I think).

iii) The operating system. This has been designed so that people who are familiar with the BBC Micro will feel at home. The windowing interface helps.

This may improve:

- Computer Concepts have written their own multi-tasking OS for their applications (they are developing a DTP package amongst others). This OS (Impulse) may be available separately.

- A improved version of the OS is under development at Acorn which, among other things, supposedly adds multitasking to the system.

Overall, its a nice machine - but its 2-300 pounds too expensive !

Well, in some of the shells I'm familiar with, you can enclose an
argument in quotes to hide special characters from the shell. In the
Bourne shell and Korn shell (and maybe cshell, though I'm not familiar
with it) you can use double quotes (") to hide some things but still
allow others, and you can use single quotes (') to hide everything. So,
your example would become:

arc a foo '*.c'

- the latter is (part of) what my "COLDBOOT" program, posted a while ago, does.
Since it is VERY short, here's a repost.

- Moshe Braner

A utility was posted a while ago to make the RESET button do a COLD reset.
I don't like that (since I want to keep the reset-proof RAMdisk) but
occasionally I do need a cold boot. Since HDB2.3 apparently does not
boot right if I leave the HD on and turn the ST off and on, I wrote the
following little ditty. It asks for confirmation, then does a cold
reset (that redoes the memory size check, although it keeps the time...).

------------ cut here ------------

I finally got a cheap fix for my SH204 (the drive mech died after 7 months
of service). Went to one of the larger local PC shops and got a used,
traded in, drive for $50 (as-is, no warranty, although they were willing
to check it out and format it for me for another $50, which I declined).
It happened to be a Seagate ST238. You might wonder how can that
30 meg RLL drive work on the SH204's MFM controller. Well, they told
me that an ST238 is really just an ST225 (20 megs MFM) tested to tighter
specs, and should work fine on my controller even though it was a bit
flaky in its former life as an RLL drive.

Replacing the drive mech in the SH204 was easy, you only need a small
Phillips screwdriver and a small wrench or pair of pliers for the nuts that
hold the controller card. Make sure you plug in the cables the same way
(relative to the slots in the edge connectors) that they were plugged
into the old drive: the Atari cables do NOT make use of the polarity
key slots on the drives edge connectors, so it IS possible to plug them
in backwards, probably smoking something.

Turned out that the original drive (a Tandon TM262) was a 3.5" drive
inside of additional hardware to make it fit where a 5.25" drive would.
The ST238 takes longer to spin up and is a bit noisier, but... when
I get rich I'll get a (logically) large, fast, quiet 3.5" SCSI drive.

The Supra formatting program didn't complain, and found no bad sectors.
If I knew it's that easy to get a cheap drive, I would've gone home-brew
from the start. The BMS boards + large case + PS + fan + clock + cables
+ instructions + SW, all for $325 --- great deal!

- Moshe Braner

>
> And that's the opinion of one concerned Atari ST citizen...
>
> Mike

What do you expect given the way Atari deals with it's
developers? Tom is just the latest in a long list of people who have
left the ST behind. I left Data Pacific because I was tired of dealing
with BS from Atari and not making much money. I still have lots of BS
to deal with but at least I'm now paid for it. Tom made essentially the
same choice months ago. He just spent a lot of time deciding what
should be his new home. The Amiga, Mac II, and IBM were all considered.
IBM won simply by market size.

Given the low sales of the ST in the US (and the low software
sales that result from that) it just isn't worth my time to put up with
the BS Atari puts out. If they had helped their developers maybe things
would be different. In a small market (the only large market is the IBM
PC) you have to give your developers support. Apple and CBM do a much
better job than Atari does, they are far from perfect but at least they
do try.

The ST is a fairly decent machine. It can be lots of fun to
work with and to program. Unfortunately it isn't a very good system to
try and live off. If Atari was interested in selling computers things
might be different. Unfortunatly they just want to design amazing
vaporware, not sell it.

One last point -- Tom is still going to support the ST. Not a
lot but some. Just like I still am going to write articles with Dave
Small. But no more trying to live off selling 2 or 4 thousand copies a
year of a program. It's real hard to live off the $4,000 to $8,000
that makes an author.

4700. re MIDI THRU

Newsgroup: comp.sys.atari.st
Date: 1988-07-21 17:23:00 UTC
From: UUCJEFF@ECNCDC.BITNET
Message-ID: <8807211725.AA17437@ucbvax.berkeley.edu>
Source record: 251650

Regarding the reader who wanted to have MIDI THRU, I know of no quick way to do it. However, it isnt too hard. Revector the MIDI IN routine to a vector which writes the MIDI byte received to the MIDI OUTPUT port. The midi vector is obtained thru the Kbdvbase() function, and the address of the midi input routine is kbp->kb_midivec.

Write a routine in assembler which writes the received MIDI byte to the Midi port. I dont recommend using Bconout or Midiws, this is inside an interupt and I have had problems using them, it is also more efficient to write the MIDI OUT port directly. Basically, it is just an address, but you have to check the status, etc. But you can copy the code directly if you have Abacus Internals or the OS listings from the developers kit. After you have the MIDI byte outputed, simply jump to the original address you got from kbp->kb_midivec.

That is roughly how it is done. I have rewritten the MIDI input routine, not to do THRU, but I have it set up so that it goes into some data structures more useful to me. It really isnt that tough.

Good luck, Jeff Beer, UUCJEFF@ECNCDC.BITNET

4701. CRAFT program development environment description

Newsgroup: comp.sys.atari.st
Date: 1988-07-21 18:29:53 UTC
From: gert@nikhefh.hep.nl
Message-ID: <490@nikhefh.hep.nl>
Source record: 251501

My mailbox is overflowing with requests for more information on the CRAFT program development environment. At first I tried to answer these letters via mail, but more and more are 'returned to sender' with host unknown errors. Therefore I'm posting the description here.

The CRAFT environment is a UNIX like development environment for the ST. It consists of a Shell and an Editor plus a number of utility programs. The Shell is almost completely compatible with the BSD Unix C-shell. The Editor is not compatible with any existing editor on Unix, but ideas for its design were taken from a number of others editors (among these unix' vi, Apollo domain editor, Norsk Data Sintran Screen editor and many others). The Editor is, as recent benchmarks in Dutch ST magazines demonstrate, the fastest available for the ST. It easily beats the (claimed fastest) editor Tempus. In most operations the speed difference is more than an order of magnitude, sometimes even more.

The Shell has most of its commands built-in for speed (especially for floppy based systems). The following list of built-ins is taken from the first level online help of the Shell:

```
CRAFT/GPshell for Atari ST Series - Version 2.0.4
(c) 1987, 1988 Gert Poletiek, ComMedia Amsterdam
70 built-in commands, 19 keywords

@ df history pathname setres

The Shell is *NOT* a multitasking environment as this causes too many problems for existing software. The following are the most important Shell

features:

- history list - shell scripts
- command line editing - I/O redirection
- user programmable - pipes
function keys - built-in ramdisk,
- filename completion printer spooler
- wildcarding using and disk cache
regular expressions - command substitution
- fontloader with - 89 built-in
7 alternate fonts functions and keywords
- Gemdos and UNIX - aliasing
style pathnames - control flow
- search paths for (such as: if-then-else)
executable programs - user definable
- full color control shell functions
- system() call interface - can run on serial port for debugging
puposes

The cache and ramdisk can be enabled and disabled at any time freeing the memory they occupy making it available for other puposes.

The Editor is fully screen oriented. Most people like the fact that the text being entered can be started anywhere on the screen, i.e. the cursor may be positioned anywhere not just inside existing text boundaries but anywhere on the screen (which for the editor is considered 256 columns by 25-32-48 rows large). The actual number of text rows depend on the screen font selected. The editor is not a GEM application although the mouse may be used to select most operations. Below you'll find a list of the most important Editor features:

. cut copy and past operations on line selections as well as on
rectangular blocks of text (column copy mode).
. automatic line indent (user [de]activated)
. automatic wrap around, supporting fortran continuation card standard
(if enabled)
. extrememly fast search and replace functions
. folds: programming language comment lines that allow you to hide
parts of the program text behind a single screen line
while editing. Folds may be nested to 32000 levels which is far
beyond the useful amount.
. editing binary files . fast search and replace
. full control over tabs . cut, copy, paste and delete
. word jumps and deletes (also in column mode)
. word wrapping and auto indent . automatic backup file generation
. 8 edit buffers . 10 learn buffers
. online help facility . redefinable keyboard
. undo on delete operations . keyboard macros
. available as desk accessory . shell escape
and application. . folds
. find current word . insert and overstrike mode

. stream editing commands for automatic text manipulation
. files size limited to 100000 lines on per edit buffer base
(or available memory, which is likely to occur before the line limit is reached).

There are several mechanisms to create your own composite commands: there are 10 learn buffers that can remember up to 100 keystrokes each. Stream editing can be done by preparing a file with edit commands. Keyboard redefinitions can put sequences of up to 510 key strokes behind a single key (or a sequence of keys). All redefinitions will be remembered across edit sessions.

The external utilties supplied with CRAFT are:

backup envtest getpr mvt setpr
cmp expand head normdisk setser
desk fastdisk make od size
du fgrep more perror tail
dump format mve pr wc

of which the backup utility is an example shell script demonstrating the programming features of the shell as well as being a useful (but not too fast) hard disk backup utility.

The CRAFT environment is extensively documented in a 640 page manual which includes tutorials as well as reference parts.

CRAFT has been tested with: Mark Williams C, Megamax C, Laser C, Aztec C, Lattice C, Alcyon C, OSS/CCD Pascal, Hisoft Modula-2, TDI Modula-2, Absoft Fortran, Prospero Fortran.

CRAFT 2.0 is just released and may be obtained from

THIS IS A PLEA FOR HELP!!!!!

If anybody has ANY infromation on Computer Viruses, Immunizations, etc.,
please forward the infromation.

I am working on a senior project on computer viruses. I would like to try
to write an immunization program, however, I cannot obtain enough information
from published literature to do so.

How do viruses work inside the computer. What are some present methods of
detection? Are there any public domain immunization programs available?
Where? Somebody wrote in one article that one could write a virus using the
pc-dos appendices as reference...I looked this up and was not too successful...
how do I do this?...What was meant by this? What are some infected programs
which were available? What is the SCORES virus? How about VirusX?, etc...

Thank you,
Marge Luecke

Help!!!

The PROG-A16 LISTSERV at CANADA01 has not been updated (no new files)
since April 28th B-(

Now I get a message that this LISTSERV is "temporarily offline"...

I have tried other LISTSERVers, but they refer me to CANADA01 "which is
closer"; so near and yet so far...

Does anyone know where I can get access to the new postings?

Also, I have tried many paths to lakesys, but totally without success
(not even a peep ;-( ).

Can some kind soul please help? I am currently looking for the latest
UniTerm V2.0d 010 or later (I think this is the most recent according
to the digest).

Thanks,
Pierre Fortin

4704. 5.25 help

Newsgroup: comp.sys.atari.st
Date: 1988-07-21 20:50:04 UTC
From: Robert_L._White.ESXC15@XEROX.COM
Message-ID: <880721-140208-4503@Xerox>
Source record: 251504

Hi, I just FTP'ed the schematic for the step doubler.
Program 40_80_tr.pi3
I have some questions though.
1) what exactly does this do? i.e. does it double the step pulse from
one pulse to two pulses, or lenghten the step pulse.

2) must you use a hi density 5.25 (1.2 meg) to use the 80 track feature? I
didnt think the standard 5.25 that an IBM uses would do 80 tracks.

I currently have a 5.25 hooked up, but have several problems. I have changed the
memory locations required to make the step pulse 6ms but still I have problems.

The problems are:
1) I cannot format the 5.25 under pc-ditto 40 track, it fails.
The drive seems to do a lot of stepping.
2) I have written a "c" program to format for 40 tracks, and that works
with no problems (no errors returned), except that I get allot of disk errors
when reading or writing. i.e. data on disk may be damaged, cancel,retry.
Sometimes a retry will work, but not allways.
3) The really strange thing is, when I format a 5.25 on a PC, I have no
problems reading or writing to that disk on my
5.25 drive on my ST. Wierd!

Any help would be nice
Thanks
Bob White, Xerox corp.

I have been sitting here reading this news group and have come to realize that a lot of people have the perception that the IDRIS has something to do with Atari. IDRIS's only connection to Atari, is that it runs on the Atari ST/MEGA hardware as well as others. IDRIS is *not* a product of Atari, and CTI and Whitesmiths *have* *never* *had* any agreements with Atari regarding their products. WE HAVE ALWAYS HAD THE PRODUCT READY AND TESTED BEFORE MAKEING ANY ANNOUNCEMENTS.

In dealing with Atari, I tend to believe that all complaints against them are true. I am not trying to defend Atari, and certainly not on the issue of the CD ROMS; I am asking people to know their facts before they put such general statements on the net. And please keep our product name out of the discussion on ``Atari none-performance''.

On the issue of MINIX-ST, please note that according to the author, *P/H will not release it until September 1988*. IDRIS has be available for the ST since Jan 1987. Although you will get the sources with the MINIX-ST product, you

will be very hard pressed to equal the performance/features of IDRIS-ST, and
of STX-Windows (our X port to IDRIS-ST).

Sincerely

4710. Picture Formats

Newsgroup: comp.sys.atari.st
Date: 1988-07-22 14:17:27 UTC
From: dmb@TIS.COM
Message-ID: <8807221417.AA01597@TIS.COM>
Source record: 251510

A while back I posted a list of picture formats here. Since then, there have been requests for additional formats. (Some errors have also been discovered).
If anyone has info regarging the following formats, please e-mail them to me. I will post the all-new-and-improved list as soon as I get some response.

Picture Formats Requested
---
1) GIF
2) Amiga IFF
3) Amiga HAM
4) MacPaint
5) GEM Metafile
6) CIS Vidtex

Thanks all,
Dave Baggett

------------------>8----Cut Here---->8-----------------------------

ST Picture Formats
------------------
Compiled by:
Dave Baggett
(arpanet: dmb@TIS.COM)

(Please report errors or additions)

CONTRIBUTORS
David Brooks Darek Mihocka Greg Wageman Gerry Wheeler

Introductory information
------------------------
word = 2 bytes
long = 4 bytes
palette = Hardware color palette, stored as 16 words. First word is
color register zero (background), last word is color register
15. Each word has the form:

Bit: (MSB) 15 14 13 12 11 10 09 08 07 06 05 04 03 02 01 00 (LSB)
-- -- -- -- -- -- -- -- -- -- -- -- -- -- -- --
0 0 0 0 0 R2 R1 R0 0 G2 G1 G0 0 B2 B1 B0

R2 = MSB of red intensity
R0 = LSB of red intensity

G2 = MSB of green intensity
G0 = LSB of green intensity

B2 = MSB of blue intensity
B0 = LSB of blue intensity

Intensity ranges from 0 (color not present) to 7 (highest
intensity).

Example: { red = 7, green = 3, blue = 5 } -> 0735 (hex)

The Formats
-----------

<NEOChrome>

1 long resolution (0 = low res, 1 = medium res, 2 = high res)
16 words palette
12 bytes filename (" . ")
```

```
1 byte Left color animation limit (starting color number)
1 byte Right color animation limit (ending color number)
1 byte color rotation speed
1 byte color rotation direction
1 word color rotation duration (number of iterations)
18 longs reserved for expansion
16000 words picture data (screen memory)
-----------
32128 bytes total

<DEGAS>

1 word resolution (0 = low res, 1 = medium res, 2 = high res)
Other bits may be used in the future; use a simple bit
test rather than checking for specific word values.
16 words palette
16000 words picture data (screen memory)
-----------
32034 bytes total

<DEGAS Elite (Uncompressed)>

1 word resolution (0 = low res, 1 = medium res, 2 = high res)
Other bits may be used in the future; use a simple bit
test rather than checking for specific word values.
16 words palette
16000 words picture data (screen memory)
4 words left color animtion limit table (starting color numbers)
4 words right color animation limit table (ending color numbers)
4 words animation channel direction flag (0 = left, 1 = off, 2 = right)
4 words animation channel delay in 1/60's of a second. [0 - 128]
-----------
32066 bytes total

<DEGAS Elite (Compressed)>

1 word resolution (same as Degas, but high order bit is set;
i.e., hex 8000 = low res, hex 8001 = medium res,
hex 8002 = high res). Other bits may be used in the
future; use a simple bit test rather than checking
for specific word values.
16 words palette
< 32000 bytes control bytes
4 words left color animtion limit table (starting color numbers)
4 words right color animation limit table (ending color numbers)
4 words animation channel direction flag (0 = left, 1 = off, 2 = right)
4 words animation channel delay in 1/60's of a second. [0 - 128]
-----------
< 32066 bytes total

Control byte meanings:

For a given control byte, x:
```

0 <= x <= 127 Use the next x + 1 bytes literally (no repetition)
-127 <= x <= -1 Use the next byte -x + 1 times
-128 No operation (ignore)

Compression Scheme:

Each bit plane is compressed separately; i.e., all data for a single
bit plane appears before any data for the next bit plane. The first bit
plane specified is the lowest order bit plane; the last bit plane to
specified is the highest order bit plane.
To clarify: The first data in the file will be the data for the lowest
order bit plane of scan line zero, followed by the data for the lowest order
bit plane of scan line one, etc., until all scan lines have been specified.
This process repeats for the next higher order bit plane (if it exists), etc.,
until all bit planes for all scan lines have been specified.

<C.O.L.R. Object Editor Mural>

16000 words picture data (screen memory)
(palettes are stored in separate files)

32000 bytes total

<Tiny>

1 byte resolution (same as NEO, but +3 indicates rotation
information also follows)

If resolution > 2 {
1 byte left and right color animation limits. High 4 bits
hold left (start) limit; low 4 bits hold right (end)
limit
1 byte direction and speed of color animation (negative value
indicates left, positive indicates right, absolute value
is delay in 1/60's of a second.
1 word color rotation duration (number of iterations)
}

1 word number of control bytes
1 word number of data bytes
16 words palette
3-10667 bytes control bytes
2-32000 bytes data bytes

42-32044 bytes total

Control byte meanings:

For a given control byte, x:

x < 0 Absolute value specifies the number of unique words to
take from the data section (from 1 to 127)
x = 0 1 long is taken from the control section which specifies
the number of times to repeat the next data word (from
128 to 32767)

x = 1 1 word is taken from the control section which specifies
the number of unique words to be taken from the data
section (from 128 - 32767)
x > 1 Specifies the number of times to repeat the next word
taken from the data section (from 2 to 127)

<Spectrum 512 (Uncompressed)>

80 words First scan line of picture (unused) -- should be zeroes
15920 words picture data (screen memory) for scan lines 1 through 199
9552 words 3 palettes for each scan line (the top scan line is
not included because Spectrum 512 can't display it)

51104 bytes total

<Spectrum 512 (Compressed)>

1 word 5350 (hex) ("SP")
1 word 0 (reserved for future use)
1 long length of data bit map
1 long length of color bit map
<= 32092 bytes compressed data bit map
<= 17910 bytes compressed color bit map

< 50014 bytes total

Data compression:

Compression is via a modified run length encoding (RLE) scheme. The
data map is stored as a sequence of records. Each record consists of a
header byte followed by one or more data bytes. The meaning of the header
byte is as follows:

For a given header byte, x:

0 <= x < 127 Use the next x + 1 bytes literally (no repetition)
-128 <= x < 0 Use the next byte -x + 2 times

The data appears in the following order:

1. Picture data, bit plane 0, scan lines 1 - 199
2. Picture data, bit plane 1, scan lines 1 - 199
3. Picture data, bit plane 2, scan lines 1 - 199
4. Picture data, bit plane 3, scan lines 1 - 199

Decompression of data ends when 31840 data bytes have been used.

Color map compression:

Each 16-word palette is compressed separately. There are three
palettes for each scan line (597 total). The color map is stored as a
sequence of records. Each record starts with a 1-word bit vector which
specifies which of the 16 palette entries are included in the data
following the bit vector (1 = included, 0 = not included; i.e., stays

the same). The least significant bit of the bit vector refers to
palette entry zero, while the most significant bit refers to palette
entry 15. Bit 15 must be zero, since Spectrum 512 does not use palette
entry 15. Bit 0 should also be zero, since Spectrum 512 always makes the
background color black.
The words specifying the values for the palette entries indicated in
the bit vector follow the bit vector itself, in order (0 - 15).

(Version of Fri Jul 22)

first of all, my name is Rosenkranz, not Rosenberg.

second, i am a professional developer on the ST (i have 3 1040 ST, 2 HD, 4 or 5 monitors, etc, etc...). i much prefer the ST of PC as far as capabilities are concerned. 68000 linear address space alone makes it far superior in my mind than dealing with stupid 16 bit addressing (segments). i was not even bashing the ST nor was i proclaiming "the PC is better". please read before you throw stones.

i have had several hardware related problems, though none with the cpu proper (except the first one i got would not even boot...i got a new one from xanth within a week). how many hard drives have YOU had to buy? atari support has been less than seemless and even that i have finally justified, at least to myself: they do the best with the resources they have.

i can't afford to play around with fancy schemes. i need to get the job done the safest, most reliable way i can. if you are a student, you probably have no idea at all what the "real" world is like. i didn't when i was. if you are a professional, you should know better.

the ST is a fine system.
the ST is a fine system.
the ST is a fine system.
the ST is a fine system.
the ST is a fine system.

There seems to be some interest in the hard drive kits from
Tech Specialties on this newsgroup lately. Some have even
mentioned problems with getting them to deliver. I do not
have a hard drive from them. However, last year I ordered a
1MB 520ST memory upgrade from them. They initially assured
me that it would ship in 2 to 3 weeks. Every time I called
them, they told me it would be an additional 2 weeks. Finally,
I received a PC board -- 5 months later! Thats bad enough, but
in addition, they forgot to put any memory chips on the board.
I called them and got chips a weeks later. I then had to send
board back to them twice (at my expense) to correct poor design
problems with their MMU "connectors". Two months later (a total
of 7 months after ordering), I finally had a working board.
A month later two memory chips bit the dust. Because of their
poor service and since I am an electrical engineer (working on
my PhD in IC design), I decided to desolder and replace the chips
myself. After another month, a third chip went out. I decided
to look into the cause of the problem. I found that the power
lines on the board were ringing between 4 and 7 volts! I replaced
the bad chip and made several changes to the board and power
connections to correct the faults in their design. The board now
works fine with no problems.

You can gather from this story that I would not personally
recommend dealing with Tech Specialties for any product that they
might offer. You may have better luck that I (even my S*NY products
seem to break). However, even if you do get a good product at a
good price from them, it will probably take several months.

At the time I ordered, they did not accept credit card payments
either. That makes it even more difficult to deal with them if there
are problems.

I have one happy story to relate. I purchased a 30MB hard disk
from MicroByte (in Texas). Their product is built by them using
the ICD controller kit. I received my drive within a week of ordering
and it has worked great (though it is a bit ugly). Their telephone
technical support is friendly and answers all questions (Tech Specialties
once hung up on me!). The 30MB MicroByte system cost me $689.

Sorry about the length of this posting. I hope it is of some help
to you.

Scott D. Willingham
willing@ee.ucla.edu

PS: I am not affiliated with Tech Specialties in any way except as a dissatisfied customer. Also, my opinions should always be assumed to be my own unless otherwise stated.

4716. Looking for cross assembler (mc6809)

Cross-posted to: comp.sys.atari.st,comp.sys.m6809

Hi there,

I am looking for a cross assembler for the Motorola MC6809 processor.
It must run on the ATARI ST or IBM PC. Who has experiences and can
recomend me a product? Who knows adresses of possible vendors?. Please
contact me directly by email.

Thanks in advance.

From: koreth@ssyx.ucsc.edu
Message-ID: <4231@saturn.ucsc.edu>
Source record: 251517

I have UUPC working fairly well now, though the mail shell is still very primitive and the uucico clone doesn't seem to handle multiple baud rates very well. If there is enough demand, I will post what I have so far to the sources newsgroup; it works under Laser C, and should work under other systems too (but no guarantees). MAIL your replies to me at the address below. I am porting news 3.0 to the ST right now, and will continue to improve the mail shell and uucico program. Note that UUPC isn't terribly useful if you already have an account on a UUCP host.

These are my opinions, and in no way reflect those of UCSC, which are wrong.

In January, I was in a shop in Hamilton, New Zealand, that was showing
the Archimedes. It seemed to be a splendid machine, but was greatly
overpriced at about 7 or 8 thousand NZ dollars. From what I
could see, the Atari still offered better value for money.

4719. 1st Word Plus bug/Wonders of resource files

Newsgroup: comp.sys.atari.st
Date: 1988-07-23 00:48:15 UTC
From: dmak@lynx.northeastern.EDU
Message-ID: <memo.39202@lynx.northeastern.edu>
Source record: 251519

This is for all ST users with 1st Word Plus from GST. There's a bug in their "WORDPLUS.RSC" file where the templates for the "editable string" fields in the dialog box for headers and footers aren't set correctly. This dialog can be reached through the menu item "Layout" under the selection "Page Layout". If the user were to try typing on any of the "_____..." lines, nothing would change. The problem is that the template for this string is a series of underscore characters -- not legal as validation characters. Instead, the character "X" should be used. I fixed my copy using Mark Williams Co's new resource editor that came with Mark Williams C v3.06 (great package!). I'm not too sure how this would be accomplished using another editor, but with MWC, the problem dialog is dialog #9.

How did I find this bug?? I was minding my own business one day, playing "Typhoon Thompson" (a new game from Broderbund soon to be released) at the computer store I work at when a customer walks in and yells something to the effect of: "Hey you!! You guys sold me a @*#& bug ridden word processor!! I have a doctoral thesis to write, and if I can't do it, I'm going to sue...." After she calmed down a bit, and explained her problem (couldn't change the page numbering from default of centered footer to right justified header) we tried it out.. Funny I said to myself... It won't allow me to enter anything on the editable strings in that dialog. Hmm... could it be a bad resource?? At this point, I prayed out loud they (GST) used a resource file (unlike some others). "Quit All", back to the desktop, look in the directory... whew! Now I load the resource editor, search for the suspect dialog, find it, check the string object and BANG.. I found the bug! Well, well... customer leaves happy and awed by the technical prowess of the staff. Point of all this?? This is one time when I actually appreciate GEM. All hail the resource file!

I'm sure Mac users discovered this joy of end-user debugging long ago tho.

In order to get most (if not all) 5.25 inch drives to work consistently on the ST, you *must* buffer the drive selects (a and b) and the side select signals from the ST. They are driven (poor choice of words ;-)) by the wimpy GI sound chip, which can barely drive the 10 inches of cable, let alone the inputs of the drive. Also, make sure to remove the termination (try this first, it may be just enough to make it work). If you set the two undocumented seek rate varaibles, and do this buffering (non-inverting, I think a 74244, but look it up first), you should have no problems.

4723. Re: viruses

Newsgroup: comp.sys.atari.st
Date: 1988-07-24 08:31:16 UTC
From: avenger@runx.ips.oz
Message-ID: <1659@runx.ips.oz>
Source record: 251523
Cross-posted to: comp.sys.apple,comp.sys.mac,comp.sys.amiga,comp.sys.ibm,comp.sys.atari.st

I was recently asked to consider this problem. The easiest solution I came up with was to write a Virus Immunisation Program (VIP) which calculated cyclic redundancy check numbers for each file on a given device and stored these numbers on a safe medium prior to backup. Regular checks
could be made using the VIP, and if the CRC on any program (executable, source, object or script) does not match (and should not have been modified) the suspect file should be restored from the backup medium.

Precautions:

1) The machine should never automatically boot from the hard disk. The operating system on that disk may be infected, and if you subsequently run your backup program or VIP, they may become infected.

2) The machine should be turned off before running either the backup program or the VIP for much the same reasons as (1).

3) Along the same lines as (1) and (2), the backup program and VIP should be contained on separate floppy disks, each with its own operating system.

Sorry about posting this to the whole net, but I was unable to get a return
path to Frisk.

Anyway, Yes Laser C does allow large arrays (>64K) they do seem to work well.
I don't know about the others. For anyone who has Megamax C the best way to
go is get the Laser C upgrade. It is $20(US), you get the new manual, and the
new distribution disks. All in all it is a nice package, and does not
cost an arm and a leg.

I am not connected with megamax in anyway other than that of a satisfied
customer.

4725. Publishing Partner Professional: First Impressions

Newsgroup: comp.sys.atari.st
Date: 1988-07-24 16:54:08 UTC
From: cdj@psueclb.BITNET
Message-ID: <1156@PSUECLB>
Source record: 251525

Last Monday (7/18) I received my copy of Publishing Partner Professional[tm] from Soft-Logik. As you know, PPP is the next generation of their successful Publishing Partner[tm] desktop publishing software. I have some mixed reactions about this program, after using it for a few hours (and also having used the original Publishing Partner for quite some time).

The package consists of one of those nifty 3-ring binders and slip-cover boxes with a very handsome logo on them. The packaging is quite nice. The manual was a bunch of shrink-wrapped pages to be inserted into the binder (no biggie...). There is ONE disk. Evidently, the same program and RSC file is used for both color and mono. Come to think of it, I didn't even try it on my color monitor (I have both); if it doesn't work, I'll post something.

The package also came with a letter stating that an informal poll of users was taken and the majority favored shipping PPP now, without fully debugging the program. Therefore, some of the features are buggy or do not work at all. This seems reasonable to me, but some of the features that do not work at all prevent the program from being even as useful as the earlier versions of PP. This is the major disappointment.

For example, one cannot import pictures into the document; try to do so will crash the program. When this bug is fixed, a multitude of picture formats are supported including DEGAS[tm], E-Z Draw Metafiles, NEO, and I may have missed one. But for now, nothing.

The biggest disappointment was that the program will not properly print out a page on my printer (C. ITOH Prowriter). This was one of the bugs that makes it unusable for me. When this bug is fixed, there are up to 7 levels of detail available for the print density. Nice, but not at the moment.

The grouping feature is VERY nice. I played with it and it works quite well. This program may be a good candidate for schematic diagrams for my labs (as well as the lab reports). One can make a library of symbols and keep them in one window, while editing your document in another window. Up to 8 windows can be open, I believe.

Several of the mouse controls are awkward, including the cancel command for graphics objects (using the right mouse button).

In Soft-Logik's defense, they are promising a free upgrade to those who send in their warrenty cards. I just hope it is soon, because until some of the major bugs are fixed, the program is unusable for me. When this program is debugged, it should really sing. It makes my mouth water just thinking about it.

4726. dead supra drives

Newsgroup: comp.sys.atari.st
Date: 1988-07-24 19:23:17 UTC
From: lharris@gpu.utcs.toronto.edu
Message-ID: <1988Jul24.152317.13719@gpu.utcs.toronto.edu>
Source record: 251526

A while back there was a big discussion on how the Supra drive
ran very hot while the Atari had disk ran cooler and how this really
made no difference in the long run. Well....
Yesterday my Supra drive died. No, it is not the power supply but
the miniscribe drive inside is trashed. When i turn it on, one hears
a metallic grinding noise. It was not moved, banged, etc - just used
last week in 90+F degree weather.
After talking to a Supra distributor, I found out this is quite common.
When the drive runs hot it expands and may trash data that has been written
before. What happened to me is more extreme - presumably the head expanded, or
a balancing counterweight expanded and fell off, trashing the mechanism.
At least my thesis was backed up on floppies.
/leonard

4727. UniTerm Kermit "File Attributes" questions

Newsgroup: comp.sys.atari.st
Date: 1988-07-24 20:32:12 UTC
From: R_Tim_Coslet@cup.portal.com
Message-ID: <7643@cup.portal.com>
Source record: 251527

To Simon Poole:

I have some questions about UniTerm Kermit.

The documentation says that UniTerm Kermit "Handles File Attributes".
What does UniTerm Kermit do with the Attributes given in the 'A' packets?

I am still extending my Kermit-UCSD and was adding "Attribute Packets"
today (the only attribute I implemented was the "Creation Date":
Attribute '#'). UniTerm Kermit appeared to act as if the contents of the
'A' packet had been interpreted as contents of just another 'D' packet
(it just put the data from the 'A' packet into the file rather than
setting the date of the file).

Is this the "normal" behavior of UniTerm Kermit on 'A' packets?

4729. Hard Disk

Newsgroup: comp.sys.atari.st
Date: 1988-07-25 06:00:03 UTC
From: landay@cory.Berkeley.EDU
Message-ID: <4654@pasteur.Berkeley.Edu>
Source record: 251529

I got my hard disk. It took me under 1 hour to get it hooked up
to the Berkeley Microsystems supplied equipment. I had a few problems
with the manual, but everything turned out o.k. there. When I tried
to format the disk, the software wouldn't recognize any SCSI devices.
It took me 2 hours to figure out what was wrong. The drive had a jumper
that had it set to drive select 2 rather than drive select 1. As soon
as I changed that everything worked fine.

NOW THE PROBLEM (Not a problem with BMS, just GEM):

I bought a fast hard disk (28ms 42meg) and partitioned it as follows:

C - ATARI 1 - 15 Meg
D - ATARI 2 - 15 Meg
E - MSDOS - 5 Meg
F - Magic Sac- 6 Meg

I thought this was reasonable. I then proceeded to copy my disks to the
hard drive. As soon as get past ~3 Megs on a partition the performance
gets very very very bad. My floppy is almost as fast. What gives????????
Did DRI screw up that bad?????? I have a 100K read/write cache on C and D.
(it didn't help much)

What is the solution. Which of those PD programs going around will solve
this? Which are SAFE??? Did Alan Pratt say this was fixed in the new ROMs?
Does ATARI have a realistic date on availability??

HELP!!!!

SIGNED - The person who spent plenty of money on a fast drive to see it wasted!

From article <1179@dutesta.UUCP>, by niels@dutesta.UUCP (Arjen Baart):
>
> Anne Steegstra writes:
>
>>Has anyone experience connecting a SCSI harddisk to the atari?
>>Does it need a lot of extra hardware. Where can I find schematics?
>
> Since I'm not too satisfied with Atari's 20MB harddisk (small, slow and
> pretty expensive), I'm considering to connect a 30 or 40 MB harddisk
> to my 520 ST+ (either SCSI or ST506). My questions are similar:

In the German magazine C'T a simple circuitboard (<= $25 cost, incl. IC's)
was shown which allowed using any ST506 disk with an OMTI5520 controller for
XT's. Driver software was published too.
Disadvantage: no booting from the harddisk.
This must be one of the cheapest ways of adding a harddisk to your ST.
I can give more specific info if someone is interested. Warning: the article
is in German. (They did the same thing for the Amiga too).

4734. Crawio()

Newsgroup: comp.sys.atari.st
Date: 1988-07-25 14:32:01 UTC
From: roeder@sbsvax.UUCP
Message-ID: <567@sbsvax.UUCP>
Source record: 251534

Can one of the BETA-testers for the new TOS-release answer the following question: what is the output of the following program under the new TOS ?

```
#include <osbind.h>
#define Stdout 1
#define PRN -3

main()
{
int f;

Crawio('A');

Fforce(Stdout,PRN);
Crawio('B');

f = Fopen("file.tst",2);
Fforce(Stdout,f);
Crawio('C');
}
```

In the older versions this little program crashes the ST after printing 'A' on the monitor and 'B' on the printer.
Should Crawio() be redirectable or not ?
- If yes, then 'C' has to appear in the file.
- If not, then 'B' and 'C' have to appear on the screen.

- Edgar

Keith,
I am using a TCP/IP package with my ST (primarily for amateur packet radio).
It does allow FTP as well as SMTP. I don't know if this is of interest but
it is in the public domain, being written by Phil Karn (radio call KA9Q), Bdale
Garbee N3EUA and others. Source code , in C, is also available. It compiles as
is with Lattice C compiler and I am most of the way through it with Laser C.

4736. Publishing Partner Professional

Newsgroup: comp.sys.atari.st
Date: 1988-07-25 18:11:49 UTC
From: fyl@ssc.UUCP
Message-ID: <1376@ssc.UUCP>
Source record: 251536

I guess I owe this to the ST community. Yes, I owned PPP for
about 1 hour. Groan.

A little background. SSC does UNIX consulting, training, sells
Pocket References and software. About 2 years ago we bought an
Atari ST and Publishing Partner to do the graphics work on our
flyers and catalog. Most of our typesetting is done directly
on a UNIX system, producing PostScript that we proof on a LaserWriter.
Final copy is done on a Linotronic typesetter.

Although Publising Partner has some bugs, it has been usable
for what we had intended. We wrote UNIX scripts to include the PP
output in UNIX typeset documents. All is sort of ok. The things we
missed were: being able to rotate text, use the downloadable fonts
with the LaserWriter and have bug-free software.

I called SoftLogik in May after I received a letter that said that
I could upgrade for only $50 if I ordered before the end of May.
The new PPP offered rotatable text and, hopefully, had fewer bugs.
I called and asked if downloadable fonts worked with a PostScript
printer. I was told, "Oh, yes, that is one of the new features."
I was going to order but was told it wouldn't be ready to ship until
the end of June. I decided to wait.

I ordered it a couple of weeks ago (still for only $50)
and got it last week. I returned it an hour later. Here is what
I found out:
* It does not support downloadable fonts with PostScript devices
* It has all kinds of new features
* It crashes under almost all conditions
* The documentation isn't really done. You get a big notebook and
a few pages of documentation
* The input files are not compatible with Publishing Partner

This last one really does it. It might, some day, be bug free
(although I doubt it as it is written in assembly language) but
the fact that we would have to throw away all of the source documents
we currently have makes it just as easy to buy a package that works.

Why do companies have featuritis? I would so much rather have
a program do what the manual says than have twice as many features,
only 20% of which actually work.

Anyway, too bad. Anyone out there know of a good program that
will do publishing stuff and produce PostScript?

Phil Hughes, SSC, Inc. P.O. Box 55549, Seattle, WA 98155 (206)FOR-UNIX

From: VBRANDT@DBNUAMA1.BITNET
Message-ID: <8807252002.AA23754@ucbvax.berkeley.edu>
Source record: 251537

A big 'thank you' to all the people who responded to my question. Yes, one
can reach netlib@lakesys from BITNET/EARN.

For users with IBM VM/CMS machines who have the CROSSNET exec: just specify
UUCP-CA as the target network.

For all others: this is the file CROSSNET sends to MAILER@UWOCC1:

```
>HELO nodeid.BITNET
>TICK 0001
>MAIL FROM:<userid@nodeid.BITNET>
>RCPT TO:<netlib@lakesys.UUCP>
>DATA
>Date: Mon, 25 Jul 88 21:50:05 SET
>To: netlib@lakesys.UUCP
>From: userid@nodeid.BITNET
>
>send index from archives.atari
>
>.
>QUIT
```

Maybe this helps others a little.

Bitnet: VBRANDT@DBNUAMA1 Volker A. Brandt
UUCP: ...!unido!DBNUAMA1.bitnet!vbrandt Angewandte Mathematik

>Program 40_80_tr.pi3
>I have some questions though.
> 1) what exactly does this do? i.e. does it double the step pulse from
> one pulse to two pulses, or lenghten the step pulse.

To make a 80-track drive read 40-track-PClone disks, it produces 2 step
impulses from one.

>
> 2) must you use a hi density 5.25 (1.2 meg) to use the 80 track feature? I
>didnt think the standard 5.25 that an IBM uses would do 80 tracks.

There are 80-track-dd-drives. The "standard IBM" uses 40-track-dd like
Teac 55B. The Teac 55F is exactly the same as the 55B, except for the
head (the 80-track type writes smaller tracks) and one resistor (for
internal doblestepping).
If You connect an 80 track drive (beware of the pullup resistors and so
on) *without* a step doubler, it "looks" like an 3.5" to the ST; the
interface Sony used for their first 3.5" drives is the 5.25"-Shugart
BUS.
The HD drives the AT uses are 8"-look alikes (to the controller chip);
they were chosen because of their speed, which is 500 kbit per second
(versus 250 from a 5.25" drive/interface). The extra capacity was a neat
bonus.
Most HD drives can "fallback" to 80 track double density, for
unformatted 1 megabytes or 720 KBytes with IBM-format. The AT software
(BIOS) does not handle this format. With double density the AT-Bioses
use double stepping to read 360 Kbyte (40 track) disks.
>
>
>I currently have a 5.25 hooked up, but have several problems. I have changed the
>memory locations required to make the step pulse 6ms but still I have problems.
>
>The problems are:
> 1) I cannot format the 5.25 under pc-ditto 40 track, it fails.
> The drive seems to do a lot of stepping.
> 2) I have written a "c" program to format for 40 tracks, and that works
>with no problems (no errors returned), except that I get allot of disk errors
Maybe that PCDitto does another doublestep (quadrostep alltogether) when
formatting 40 tracks. Try do disable you step doubler.
Or PCDitto does not use the TOS-step rate code ans steps with 3 msec.
Ask the authors of PCDitto.

I hops this helps a little

This is an addition to my previous posting. I forgot but there
is nothing in the new manual about the keyboard sequences used
to perform functions and the keyboard equivalents have been removed
from the drop-down menus. I tried my usual ones, load, save,
bold, italic, etc and they no longer worked. Either they changed
or Softlogik thinks people really like to use drop-down menus to
change into and out of bold when entering text.

The problem is how GEMDOS does the FAT lookup. There are several PD programs which will fix the problem, the best is probably FATSPEED. I have used it with no problems, and the difference in speed is enormous. Hope this helps,

Message-ID: <784@tnosel.UUCP>
Source record: 251541
Cross-posted to: comp.graphics,comp.sources.wanted,comp.sys.atari.st

I am looking for software that is capable to visualize a model (a building)
that is described by a bunch of faces (in a ASCII-file).
The program should come close to an animation-program in order to 'walk'
through a model. Target machines are a UNIX-68020 workstation, Mac SE or
an atari-ST.

Please reply by e-mail (I will summarize to comp.graphics).

I don't know what Acorns policy is for sales to New Zealand but I
believe that they actually had some sucess with the BBC in
Australia so perhaps they are prepared to push the Archimedes in that
part of the world.

I have just read an article in Computer Weekly about the Archimedes and
the ARM RISC chip set. Acorns Dirrector of Sales and Marketing, Ian
Laurence, is quoted as saying that "We (Acorn) would love it to
happen (a US cheap workstation manufacturer using the ARM) because
there is no way we could sell Archimedes in the US. The Americans
are very parochial." ???

So it doesn't look like the Archimedes will make it to the US unless
Acorn have a major change of policy.

Date: 1988-07-26 13:39:13 UTC
From: deich@well.UUCP
Message-ID: <6631@well.UUCP>
Source record: 251545

I would like to know anyone's opinion on Aztec C for the ST. They have
this deal going on until 8/31/88 for:
Source debugger $75.00
Prof System $99.00 includes compiler,assembler,overlay linker with
libraries, Unix and other libraries and utilities.

Dev System $150.00 includes prof system and make,diff,grep, and
a vi editor.

Library Source $300.00
OR Dev sys with Source Debugger and Library Sources FOR $399.00

I have not seen any references to Aztec here. So I thought I'd try and see if
any one had any info before I go out and buy it.

Phil, Publishing Partner Professional's schedule slipped one heck of a lot since it was originally announced. On June 28th +/-, they took a survey on GEnie, asking if we, the registered users who had sent in the upgrade fee, would like to recieve a BETA copy of PPPro. The response was almost unanimous that we'd like to see it in its present, very unfinished form.

SoftLogik has made it VERY clear that that program DOES NOT WORK in its entirety. They are the first to admit that there are many, many, many bugs and crashes. This version was released to show us what features will be available in the final version. Many of the bugs that are in this BETA version worked on previous BETA versions.

The ability to import Pub. Partner version 1 files is a #1 priority, as is the ability to covert version 1 font files.

They have made it abundantly clear that this BETA version was not intended for anyone to do any useful work with it. The manual is a quickly put-together so you can see the features. The final manual will fill that 3" binder they sent. I have faith that the final version will encompass all the features that they have announced.

The opinions expressed are my own and do not reflect the opinions of my employer or anyone else.

4749. Picture Formats Correction

Newsgroup: comp.sys.atari.st
Date: 1988-07-26 16:07:05 UTC
From: dmb@TIS.COM
Message-ID: <8807261607.AA04937@TIS.COM>
Source record: 251549

The description of Degas Elite compressed was wrong in the list I posted on
Friday. Oops. Turns out that the later Degas Elite manuals were "edited"
to the point that the descriptions of the compression schemes were made
thoroughly misleading.

Thanks to David Brooks for pointing out the error (and the correction).
Here's the corrected version:
(assuming I didn't screw something up again!)

```
---------------------------->8 Cut Here >8 ---------------------------------

ST Picture Formats
------------------
Compiled by:
Dave Baggett
(arpanet: dmb@TIS.COM)

(Please report errors or additions)

CONTRIBUTORS

David Brooks Ken MacLeod Darek Mihocka George Seto
Joe Smith Greg Wageman Gerry Wheeler

Introductory information
------------------------
word = 2 bytes
long = 4 bytes
palette = Hardware color palette, stored as 16 words. First word is
color register zero (background), last word is color register
15. Each word has the form:

Bit: (MSB) 15 14 13 12 11 10 09 08 07 06 05 04 03 02 01 00 (LSB)
-- -- -- -- -- -- -- -- -- -- -- -- -- -- -- --
0 0 0 0 0 R2 R1 R0 0 G2 G1 G0 0 B2 B1 B0

R2 = MSB of red intensity
R0 = LSB of red intensity

G2 = MSB of green intensity
G0 = LSB of green intensity

B2 = MSB of blue intensity
B0 = LSB of blue intensity

Intensity ranges from 0 (color not present) to 7 (highest
intensity).
```

```
Example: { red = 7, green = 3, blue = 5 } -> 0735 (hex)

The Formats
-----------

<NEOChrome>

1 long resolution (0 = low res, 1 = medium res, 2 = high res)
16 words palette
12 bytes filename (" . ")
1 byte Left color animation limit (starting color number)
1 byte Right color animation limit (ending color number)
1 byte color rotation speed
1 byte color rotation direction
1 word color rotation duration (number of iterations)
18 longs reserved for expansion
16000 words picture data (screen memory)
-----------
32128 bytes total

<DEGAS>

1 word resolution (0 = low res, 1 = medium res, 2 = high res)
Other bits may be used in the future; use a simple bit
test rather than checking for specific word values.
16 words palette
16000 words picture data (screen memory)
-----------
32034 bytes total

<DEGAS Elite (Uncompressed)>

1 word resolution (0 = low res, 1 = medium res, 2 = high res)
Other bits may be used in the future; use a simple bit
test rather than checking for specific word values.
16 words palette
16000 words picture data (screen memory)
4 words left color animtion limit table (starting color numbers)
4 words right color animation limit table (ending color numbers)
4 words animation channel direction flag (0 = left, 1 = off, 2 = right)
4 words animation channel delay in 1/60's of a second. [0 - 128]
-----------
32066 bytes total

<DEGAS Elite (Compressed)>

1 word resolution (same as Degas, but high order bit is set;
i.e., hex 8000 = low res, hex 8001 = medium res,
hex 8002 = high res). Other bits may be used in the
future; use a simple bit test rather than checking
for specific word values.
16 words palette
< 32000 bytes control bytes
4 words left color animtion limit table (starting color numbers)
```

4 words right color animation limit table (ending color numbers)
4 words animation channel direction flag (0 = left, 1 = off, 2 = right)
4 words animation channel delay in 1/60's of a second. [0 - 128]

< 32066 bytes total

Control byte meanings:

For a given control byte, x:

0 <= x <= 127 Use the next x + 1 bytes literally (no repetition)
-127 <= x <= -1 Use the next byte -x + 1 times
-128 No operation (ignore)

Compression Scheme:

Each scan line is compressed separately; i.e., all data for a given
scan line appears before any data for the next scan line. The scan lines
are specified from top to bottom (i.e., 0 is first). For each scan line,
all the data for a given bit plane appears before any data for the next
higher order bit plane.
To clarify: The first data in the file will be the data for the lowest
order bit plane of scan line zero, followed by the data for the next higher
order bit plane of scan line zero, etc., until all bit planes have been
specified for scan line zero. The next data in the file will be the data
for the lowest order bit plane of scan line one, followed by the data for
the next higher order bit plane of scan line one, etc., until all bit planes
have been specified for all scan lines.

<C.O.L.R. Object Editor Mural>

16000 words picture data (screen memory)
(palettes are stored in separate files)

32000 bytes total

<Tiny>

1 byte resolution (same as NEO, but +3 indicates rotation
information also follows)

If resolution > 2 {
1 byte left and right color animation limits. High 4 bits
hold left (start) limit; low 4 bits hold right (end)
limit
1 byte direction and speed of color animation (negative value
indicates left, positive indicates right, absolute value
is delay in 1/60's of a second.
1 word color rotation duration (number of iterations)
}

1 word number of control bytes
1 word number of data bytes
16 words palette

3-10667 bytes control bytes
2-32000 bytes data bytes

42-32044 bytes total

Control byte meanings:

For a given control byte, x:

x < 0 Absolute value specifies the number of unique words to
take from the data section (from 1 to 127)
x = 0 1 long is taken from the control section which specifies
the number of times to repeat the next data word (from
128 to 32767)
x = 1 1 word is taken from the control section which specifies
the number of unique words to be taken from the data
section (from 128 - 32767)
x > 1 Specifies the number of times to repeat the next word
taken from the data section (from 2 to 127)

<Spectrum 512 (Uncompressed)>

80 words First scan line of picture (unused) -- should be zeroes
15920 words picture data (screen memory) for scan lines 1 through 199
9552 words 3 palettes for each scan line (the top scan line is
not included because Spectrum 512 can't display it)

51104 bytes total

<Spectrum 512 (Compressed)>

1 word 5350 (hex) ("SP")
1 word 0 (reserved for future use)
1 long length of data bit map
1 long length of color bit map
<= 32092 bytes compressed data bit map
<= 17910 bytes compressed color bit map

< 50014 bytes total

Data compression:

Compression is via a modified run length encoding (RLE) scheme. The
data map is stored as a sequence of records. Each record consists of a
header byte followed by one or more data bytes. The meaning of the header
byte is as follows:

For a given header byte, x:

0 <= x < 127 Use the next x + 1 bytes literally (no repetition)
-128 <= x < 0 Use the next byte -x + 2 times

The data appears in the following order:

1. Picture data, bit plane 0, scan lines 1 - 199
2. Picture data, bit plane 1, scan lines 1 - 199
3. Picture data, bit plane 2, scan lines 1 - 199
4. Picture data, bit plane 3, scan lines 1 - 199

Decompression of data ends when 31840 data bytes have been used.

Color map compression:

Each 16-word palette is compressed separately. There are three
palettes for each scan line (597 total). The color map is stored as a
sequence of records. Each record starts with a 1-word bit vector which
specifies which of the 16 palette entries are included in the data
following the bit vector (1 = included, 0 = not included; i.e., stays
the same). The least significant bit of the bit vector refers to
palette entry zero, while the most significant bit refers to palette
entry 15. Bit 15 must be zero, since Spectrum 512 does not use palette
entry 15. Bit 0 should also be zero, since Spectrum 512 always makes the
background color black.
The words specifying the values for the palette entries indicated in
the bit vector follow the bit vector itself, in order (0 - 15).

I already received E-mail pointing out that PPP doesn't do everything because it is the beta version and Softlogik released the beta version because people kept asking for it. Here are the facts behind the rumors :-) :-)

I never requested a beta version of anything. Softlogik made me an offer to upgrade for $50. It sounded good and I called them to make sure it would do downloadable fonts on PostScript printers. I was told that it would and was asked if I wanted to place the order over the phone. I asked, "Is it ready to ship?" I was told, no, it wouldn't be ready until the end of June (this was mid-May). Even though the $50 deal was supposedly good only through May, I elected to wait and order when the software existed.

When I called in mid-July and asked if it was ready to ship, I was told, "Yes, we started shipping it last week." I was also told that I could still upgrade for $50. So, I did.

The program I received did not say "beta version". There was a list of bugs (some bad enough to make the program almost useless) and a card to return that stated this wasn't the final version and if I returned this I would get upgrades.

To me, the final version of software is the one you archive when you have stopped using the software. To me, this didn't imply that I have received a beta version and someday they would ship the real version. Nor would I have ordered a beta version. I want to use this product, not test it. I can survive with the old PP until a stable version is produced.

Further, lots of things that worked perfectly in PP don't work in PPP. For example, keyboard sequences for commands in the drop-down menus. I would have prefered to pay $50 for a version of PP with the bugs fixed rather than $50 to get a program that isn't compatible with PP and doesn't work.

I'm sorry if this sounds like ranting but I have been in the software racket for 20 years. I worked on testing an operating system for Computer Sciences Corporation. There were 20 people in the test group. Our product worked. I now work for a company that, among other things, sells software for UNIX systems. Sure, it isn't perfect software but it works, we support it and generally it is supplied with source code so you can fix a bug. Prices are fair, features are reasonable. We don't offer binaries of programs that supposed to do everything but have so many bugs they can't be used.

If we, as ST users, want to see people accept the ST as more than
a toy, we have to expect both Atari to produce hardware that doesn't
break and the software vendors to produce software that works.
Otherwise, people will buy Macs. They may be a dog but the software
for them runs.

4752. Re: Supra hard drives

Newsgroup: comp.sys.atari.st
Date: 1988-07-26 21:53:39 UTC
From: david@bdt.UUCP
Message-ID: <355@bdt.UUCP>
Source record: 251452

I'm sort of amazed that there are so many people recommending Supra
Drives. I must have had a unique experience, but oddly with all the
ST hard drives we use at BDT, the *only* drives that have ever given
us trouble have been the Supra Drives and an Astra Drive. Even
the Atari drive, an original developers SH204, has worked without
failure (althoough I expect it will die someday soon becuase it
has a Seagate ST225 inside). We have many BMS 100 drives (34.5 MB),
2 Supra Drives, 1 Astra Drive, and 1 SH204 (all 20MB). Both Supras
have failed more than once - each time it has been the Supra interface
board. The Astra drive completely went away and it had to be
replaced with a BMS set-up.

4753. Archimedes

Newsgroup: comp.sys.atari.st
Date: 1988-07-26 22:34:19 UTC
From: damir@duttnph.UUCP
Message-ID: <8807262234.AA14181@duttnph1.patroon.nl>
Source record: 251453

Considering the existing interest in new and exciting computers among
the Atari ST users I thought it useful say something about the Archimedes
RISC machine. In the past month I have ported a large program that was
running on the ST to the Archimedes.
Facts: the machine is fast, typically in integer calculations 3 to 4
times faster than the ST. In floating point it is still faster
but don't expect miracles here. The FPP is not yet available.

the operating system is disgusting if you usually work on a UNIX
system. Not a single command is the same as in UNIX and the help
facility is hardly useful. This only applies to the 'shell', the
low-level system calls are well thought-out and very powerful.
A third-party developer should sell a new shell and all would be
well. There is also a DESKTOP build into the ROM but that's
something we can only laugh about, useless.

the native language of the machine seems to be BASIC, in my opinion
the gravest mistake of the makers. The software package I have
ported was completely written in C and the ANSI C compiler that
comes with the machine is pretty good although it is lacking
a good optimizer. The original code was written for Mark Williams C
and the only changes I made had to do with UNIX-type C to ANSI C and
naturally the GEM and O.S.-specific parts.

the windowing system (WIMP) is quite powerful in performing simple
tasks so a lot is done for you by the dispatcher but support of pieces
of text and dialog-boxes is limited.

the hardware is well-designed and looks sturdy except for the mouse.

the prices are too high but that's normal for new computers but
more important there is hardly any software at this moment. This
should improve in the near future.
the machine is available now in the Netherlands and Germany outside
of the U.K.

Damir

Delft University of Technology, The Netherlands.

disclaimer: I have no commercial connection with the Archimedes. My program
will come into the P.D.
The opinions above are all mine personally.
I am not saying that any computer is better than any other computer.
My /dev/null has unlimited capacity for flames.

Source record: 251454

I think Dan Moore hit the nail on the head here so I'm not going to say the same thing again. But I would like to add the following.

If it appears that Dan is bitter, he probably is. I think one reason some of us who were there in the beginning with the ST are so frustrated is becuase we like the ST, for the most part, and a lot of us saw a time when Atari really could have done something with it. It was one of the first exciting computers in that market in a long time. We saw the chance for success and we saw Atari screw it up, and in the process, hurt a lot of people. I think it's also becuase we feel a little stupid for not listening to everyone who told us that it was a big mistake to get invloved with Atari and the Flying T's but we did it anyway - live and learn.

4756. SM124 Differences ?

Newsgroup: comp.sys.atari.st
Date: 1988-07-27 09:38:20 UTC
From: XBR3D815@DDATHD21.BITNET
Message-ID: <8807270941.AA03440@ucbvax.berkeley.edu>
Source record: 251456

Hi Atarians!

Is someone out there in netland who knows a difference between older and the newest SM124 B&W-monitors which could explain the following behavier:

Mega ST4 and old (Oct. 87) Monitor:
In reverse mode (light text on black background) is brightness dependent on information on screen ! If you have >20 charcters displayed, text is light, but if characters are deleted the text begins to fade so that you have to adjust the brightness control! But if now more caracters are typed text becomes brighter again so the brightness control has to be adjusted the second time and so on.

Mega ST4 and new (Mar. 88) Monitor:
The symptom does not occur !

This is not dependent on the ST! We tried several ST4 and one ST2 with the same results.
Is there a possible fix for this behavier ? Perhaps can someone at Atari give some hints? We know solder irons and will change the monitor circuitry if necessary, so please HELP!!!!

4762. Another lakesys problem

Newsgroup: comp.sys.atari.st
Date: 1988-07-27 17:35:51 UTC
From: AB084@DK0RRZK0.BITNET
Message-ID: <8807271734.AA10263@ucbvax.berkeley.edu>
Source record: 251462

The following is a "returned mail" from lakesys. Obviously the address
works, but the local mailer does not know NETLIB. The problem seems to
have to do with the capitals. But even if I enter the address in small
letters the gateways will convert it to upper case. I always thought
it was standard that the case does not matter (RFC???). Am I wrong?
Of course, I see that the error message comes from a UNIX machine and
I know that under UNIX cases DO matter. But there should be a way to
avoid this problem.

>I know of that was posted to comp.binaries.atari.st or whatever that stream
>is called. Did I miss a newer one?

I think, it would be a good idea to repost the newest version.
It is not very efficient to ftp it to europe several times.

Now my problem or question. How about a gulam-accessory. I've got a
PD-shell-accessory (bourne-shell), which i use quite frequently.

I don't want to totally resign GEM and would like to have gulam as
an accessory. Does anybody know, if this is possible? My shell accessory
can't execute gem-programs, but it can handle system() calls. It reads
the profiles at boot time and then you can call it in no time out of
every program.

With the new Mega STs, the memory should be no problem.
How would you like such a program and who could do it :-) ?

Michael

IDRIS for ST/MEGA is $149.95 (US), STX-Windows is $49.95 (US).
There is a 25% discount for educational institutions if purchased with an
authorized purchase order from that institution. Please note that you
will need IDRIS to run STX-Windows.

4765. pd 68K floating point routines (gnulib.c)

Newsgroup: comp.sys.atari.st
Date: 1988-07-27 23:26:29 UTC
From: jsm@phoenix.Princeton.EDU
Message-ID: <3345@phoenix.Princeton.EDU>
Source record: 251465
Cross-posted to: comp.sys.atari.st,comp.sys.m68k

I couldn't find any IEEE-style floating point packages for the 68000, so
in my spare time I hacked one together. It probably has *lots* of bugs, but
it seems to work. Those on the internet can obtain a copy via anonymous
ftp from either:

princeton.princeton.edu in the file /pub/gnulib68k.c
-or-
prep.ai.mit.edu in the file /usr/ftp/pub/gnulib68k.c

Those not on the internet can email me, and if there is sufficient interest,
I'll post it to the net.

It is designed to replace the file gnulib.c in the gcc distribution and
compiled using gcc with the -O option, but others could cannibalize the
floating point routines for their own purposes.

Hope this is useful,

Scott

I rarely make requests, but I have one here.

Two things......

Is there someone out there that has the sysdeph.h file for
STadel version 3.0(c). It's kinga hard to make a program
compile without this include file ;^}

Two....

I am looking for the latest version if STadel, 3.1xx. This
version has the Ymodem Batch code in as well as the UUCP code.

I had gotten a version 3.2x but this version refuses to work
with the newer roms (mega roms) while the other have no
problems.

If someone could help me out, it would be greatly appreciated, and
will place the latest STadel version in netlib@lakesys archives.

Finally! Laser C is now also available in Germany.

Tuesday last week I received an order form saying I could get Laser C as an update to Megamax C V1.1 for DM 80.00 (approx. $43, sigh). I ordered it immediately. Yesterday it came from Application Systems Heidelberg, Megamax' german distributor, on two double-sided disk (well, they used single sided ones formatted as double-sided). I installed it on my harddisk and haven't had any problems yet. The manual seems to be complete and makes a very good impression.

I haven't seen this problem on the Atari, but I have seen it on other systems. (Usually the ones with a cheap monitor.) And, I recall from somewhere in the dark past that monitors used to come with a switch labelled "DC offset" or some such. This allowed you to set the monitor for automatic brightness when you used it for television work, and to disable that feature for computer work. Maybe your monitor is set up the wrong way? Maybe it needs repair? I use an old old monochrome monitor on a 520ST and it has no problem whatsoever.

4773. Multisync Monitors on Mega ST

Newsgroup: comp.sys.atari.st
Date: 1988-07-28 22:31:22 UTC
From: Steve_Cobrin.SBDERX@XEROX.COM
Message-ID: <880728-153327-3812@Xerox>
Source record: 251473

Hello Atari Folk,

I am trying to investigate running a Multisync Monitor off the Mega ST I am about to buy.

Reasons

- I want to avoid buying 2 monitors.
- I'm intending to do lots of programming and DTP, and would like to use a high quality monochrome monitor (at least as good as the SM124). Paper white strongly preferred.
- I also want to be able to play ST games, and therfore need good colour monitor quality (with minimal ghosting).
- I also want to (as much as possible) future proof my monitor purchase.

What I already know

I need a monitor which has a horizontal scanning frequency of 31 kHz (approx) and a vertical scanning frequency of 71 Hz.

I believe that I can achieve the above by buying something like:
NEC Multisync II
Hitachi Multi 560
Taxan 770
Philips CM8873
only this has a built in speaker, but I understand its easy to fix one to the others)

Questions

- Can anybody make any recommendations for the above monitors or indeed make any other recommendations. A guy in a shop was muttering about something called a TVM but I haven't found out anything about it.
- The Philips isn't supposed to go to 71 Hz, but I've heard of people using it, any comments?
- How easy is it to provide an external speaker?
- Just in passing, is there any way to get the NEC Multysync Plus going.
- How will I be able to tell the Mega what sort of mode I want to run in. I understand this normally involves setting one of the monitor pins high, causing a reboot. An Atari person told me that its possible to do this without a reboot, can anybody cofirm this?
- Can I actually achieve my goals, or should I just accept that I should get 2 monitors.

Gee, I paid $600 for Idris. It didn't even come with a decent editor (ve???).
I haven't received any notification through the mail about X-Windows, or any
other additions to Idris (like a decent editor). I was under the impression
that the reason we had to pay so much for Idris was that we were going to get
lots of support! What support? I have to wait until I see a posting on the
net before I find out that X-Windows (not even X11) is now available, and I'll
probably have to shell out another $50 for it?! Tell me this isn't true!

Message-ID: <5678@batcomputer.tn.cornell.edu>
Source record: 251475

[]

In a flyer from Priority One Electronics (came with the August BYTE)
there's an ad for two VGA monitors, a mono one for $150 and a color one
for $460. The former is claimed to work with "50 to 70 Hz refresh",
the latter 60 to 70. The mono one has white phosphor and supports
64 shades of grey. Both are supposed to display ALL the VGA resolutions,
up to 720 by 400 text and 640 by 480 graphics.

Question is: can either of these (or other VGA monitors) be used on
the ST, perhaps for BOTH the ST hi-res and med-res (and lo-res?) modes?
What would it take to connect them?

Any PS/2 experts out there? (On this newsgroup? Nyaaa...)

>XT's. Driver software was published too.
>Disadvantage: no booting from the harddisk.

And the HD-Port is not useble for other devices (tapes or the like).
They just provide the signals the OMTI wants by software. They do not
use the adressing sheme and protocol Atari defined for the HD-Port.
So it is not compatible with *any* software that does adress the HD
directly (not via system calls).

It is bootable by now (with a ROM patch).

I would not call myself an expert on PS/2s, but I do know more than a lot of folks when it comes to VGA adapters and monitors -- the VGA monitors (not the multisync ones but the real PS/2 clones) are fairly tightly coupled to a 31 KHz horizontal frequency and a vertical rate of 50-75 Hz (depending on the horizontal and vertical sync polarities).

I think that matches the hi-res mono monitor pretty closely (and both are analog, so a fairly simple cable should be all you need to tie the mono monitor into an ST), but the color monitor runs at the old CGA standard frequencies (much lower, 16 KHz or thereabouts, I think) so it would require a real multifrequency monitor. And in that case I think you have to switch the mono monitor sense line to "confuse" the computer.

Well I got my upgrade to Publishing Partner and I can't wait until the finished version will be out. I don't have any problem with them sending me a Beta version of the product. The only problem I have is that when I called them I got a recording that said They Were now shipping PPP for the St and that the Amiga version will soon follow.

WHY DIDN'T THEY SAY WERE ARE SHIPPING A BETA VERSION !!!!!!!!!!

I tend to beleive they shiped the beta version so that they could cash my check.

> + instructions + SW, all for $325 --- great deal!

The formatting program CAN'T find any bad sectors if you have the stock SH204 host adaptor board. The PAL used by Atari on the SH204 doesn't correctly return error status from the SCSI controller, so you won't find bad sectors that do exist. BMS has a replacement chip that fixes this problem, and they only want 20 bucks for it. Run, don't walk, to the nearest phone.

In article <1.22EEA4B4@rubbs1.UUCP> Chris_Tuttle@rubbs1.UUCP (Chris Tuttle) writes:
>
> Well I find Shadow useless anyway.Mostly because you need more then a meg for real use of the program.If you download more then your buffer takes,TOO BAD IT ABORTS THE WHOLE THING! and most of my files are more then 400k which is the most memory I can handle on my 1-meg 520.But Shadow first says its initializing then sorta crashes and say that shadow is installed most likely SHADOW.INF isn't installed on the MAIN directory of your current drive(Mines drive C: because I boot from Hard Drive)

Dear Chris:

Plz read your manual. SHADOW does not crash, but performs a cold boot
in order to setup the reset-proof transfer area. This is necessary to allow
SHADOW to continue up/downloading even after you press the RESET button, switch
monitors, or change rezs.
Not having SHADOW.INF on the root level makes no difference what-so-ever
to SHADOW. SHADOW has built-in defaults to overcome such deficiencies. In
addition, you can have a desktop icon for SHADOW (in place of SHADOW.INF).
I agree that SHADOW will put the pinch on 520K systems, because of the
need to have the file transfer buffer. However, in order to allow SHADOW to
run during any program (.tos, .ttp, or .prg) means that you must have some
place to save your data because you can not easily perform disk I/O on the
interrupt level.
If you are familiar with Interlink's 'background' file transfers, then
you know the limitations of virtual spooling to disk, ie. you can only use
GEM programs while up/downloading, and when it accesses the disk (via the desk
accessory) the system halts completely.
Interlink's next version will allow background transfers during all
programs (supposedly) and will use a concept similar to ours, ie. a buffer
to hold the largest expected file.
In order for us to provide virtual file spooling to disk, we would have
to rewrite ALL disk drivers to be re-entrant, and provide for a method of
collision avoidance when the foreground program wants the disk, but the
interrupt program (SHADOW) is using the disk (or vice-versa).
We are working on disk I/O during interrupts, but TOS is not the best
to patch up in this area. And thinking of all possible scenarios is quite a
challenge, especially when dealing with interrupt level programming.
Sorry if I sound like I am flaming, but we HAVE (despite some beliefs)
put much time, thought, design, and sweat into SHADOW.

BTW - I hate seeing the replies before the real message.. damn usenet
BTW-BTW - For all you SHADOW owners, look for a patch program posted
here this weekend (upgrades to 1.01)

- Mike

4785. Prolog interpreters

Newsgroup: comp.sys.atari.st
Date: 1988-07-29 17:36:04 UTC
From: mvo@cbnews.ATT.COM
Message-ID: <742@cbnews.ATT.COM>
Source record: 251485

I am interested in buying a particular Prolog interpreter for my ST.
I believe the name of the package is ExPro, and that it is sold by Rational
Visions, but that is all the information I have. There was supposedly a
review of Prologs in STart magazine, but I don't have that issue.

Does anyone have any information on this package or the company?
I especially need the phone number for Rational Visions. Any info on
other Prologs is of interest as well.

This package was recommended by a prof at CWRU, so maybe someone there
can help.

Thanks in advance.

"The Catalog" lists a PD 'roff' - never tried it.
I would surely love to have some document building software like
LaTex, eqn, tbl, ditroff... for the ST with filters for
PostScript, Imagen or HP!!

If any one knows of such please post!!

Elan Computer Group sells a package called NROFF/PC including:

Nroff, Tbl, Neqn, MM macros, MAN Macros, Checkmm, and User manual

all for $99. The code is honest-to-god Nroff, et. al., from AT&T,
ported to DOS (with enhancements for speed under DOS). Contact:

Elan Computer Group, Inc.
410 Cambridge Avenue, Suite A
Palo Alto, CA 94306
415-322-2450

If you can't afford the $99, Alan's is a pretty good deal at $30 (besides,
he's a nice guy too.) However, from our use, it does not appear to be
completely compatible with UNIX Nroff. For example, AT&T Tbl does not work
with it.

4794. New Atari computers....

Newsgroup: comp.sys.atari.st
Date: 1988-07-30 10:15:04 UTC
From: ian@umd5.umd.edu
Message-ID: <2950@umd5.umd.edu>
Source record: 251494

OK, I have a 1040ST and have had it for 2 years. It has served
me very well in what I wanted to do - infact it was a quantum leep up
from my old Apple][+ system. But now I find that the computer arena
feels stagnant, lacking in innovation and real growth. We have the PS/2,
the Mac][, and that's about it here in the US as new things go - and they
aren't much better than their earlier ancestors.

What is Atari gonna do? We all hear rumours about the new stuff
from Commodore, and about new stuff from Atari - all the transputer stuff,
the 68020 and 68030 stuff, but where is it and is it aimed at all of us
'under $1000' computer junkies? I am not gonna go out and pay $3000 for
any system no matter how fancy while I can still do decent work on my
ST. But I will admit that if anything spectacular breaks even the $1500
price line I will be tempted. Time for a change, you know.

So what is coming around the mountain? What is on the horizon?
When can we expect some 'new blood' in this slightly stale arena?

Rick Random - a man for all reasons....

I think I have an archive server working fairly well on ssyx, so I'm making the sources and binaries archives available. Send mail to

archive-server@ssyx.ucsc.edu

or

...!uunet!ucbvax!ucscc!ssyx!archive-server

with the word "help" on the first line for instructions. The archives are also available via anonymous ftp from ssyx (128.114.133.1), though our network connection is very slow right now, so the archive server is more reliable.

My thanks to steven@lakesys for providing the server software.

From: Friesen@HIS-PHOENIX-MULTICS.ARPA
Message-ID: <880730235329.202059@HIS-PHOENIX-MULTICS.ARPA>
Source record: 251496

OK, this is what I found out (I am not including any rumors, I got this info. form either "reliable sources" or my dealer, however, don't hold me to any of this).

An ST can be upgraded over four megs. The extra memory will only fit inside a Mega, you need a seperate case for 520's and 1040's. A company is working on a board that goes in the Megas expansion slot that adds more memory. And no one seems to know what kind of incampatability problems there will be if you go over four megs.

Please add info. if you have some or correct me if I'm wrong.

From: thelake!steve@stag.UUCP (Steve Yelvington)

I would like to hear from anyone who has used any Usenet-
compatible software for the ST.

I'd like to know:
* How easy is it to set up?
* How easy is it to use?
* Is it reliable?
* How may it be obtained?

UUMAIL and STadel BBS I know about. (I formerly sysoped a BBS under
STadel, and I use UUMAIL here at thelake.)

I'm particularly interested in hearing from people who have used
anything else: Beckemeyer's UUCP or any of the public-domain
alternatives (UUPC, UUSLAVE, etc.)

Please respond via email. Note that thelake is not a "registered"
node, but most smart mailers seem to have heard of stag.

4801. Bug in MWC 3.0

Newsgroup: comp.sys.atari.st
Date: 1988-07-31 23:32:12 UTC
From: Gribnif@UMass.BITNET
Message-ID: <880731193042228.ACQF@Mars.UCC.UMass.EDU>
Source record: 251401

Greetings,

It would appear that I have truly found a real honest-to-goodness bug in MWC 3.0.6. The following is a code segment that was compiled with the -VPEEP option.

```
int in_wind[7], max_itm[7], w_num, rez;
...
slider()
{
int b;

...
if( (b = b * in_wind[w_num] / (max_itm[w_num]+in_wind[w_num]))
< (4<<rez) ) b = 4<<rez;
...
}
```

A disassembly of the first part of this statement:

```
slider_+0x282 moveq.l $0x4, d2 / correctly moves 4 into d2
slider_+0x284 move.w rez_, d2 / then overwrites d2 with rez
slider_+0x28A lsl.w d2, d2 / result is rez<<rez, not 4<<rez
```

If the condition proves to be true, then "b" is assigned correctly; the code generated uses d0 and d2 to do the shift.

This may or may not be related to the -VPEEP option, though this is the first time I have had any trouble with it. I just thought you all might like to be aware of this problem.

> Bill dorsey billd@apple.com

You may not have to!!

The price you paid includes the Whitesmiths C compiler. We had a price change which I posted about 2, or 3 months ago. IDRIS ST with Whitesmiths C compiler and libraries, Pascal compiler and libraries and STX-Windows is $600, which is what you have minus the STX-Window, and Pascal compiler.

If you have software maintenance support (i.e. sent in the registeration card and have signed for annual maintenance), or have IDRIS 3.11 or later, you will get the STX-Windows and documentation, plus the kernel to support it, for the cost of the media, and handling (5 micro floppies).

In regards to support, it means if you encounter a problem, you can call us, and we will either solve the problem right-away, or enter it into the bugs-to-be-fixed basket (overseas customers are responded to via fax). The more sever a ``real'' bug, the faster it gets tended to.

I usually try to post most of the important news about our ST related products to this news group, without taking too much of the bandwidth. We will try to be more ``marketing'' oriented in the futurer; I however, suggest that our customer call or write us every few months and ask us about the new and upcoming things, and we will give you latest.

The public domain libraries include much better editors like microGNU-emacs and Stevie editors. They also include things IDRIS is lacking, like Gawk. PD disks include all sources and are $4 per diskette.

I would like to apologize to our customers for not having better means of informing them of price changes and software updates, and our only excuse is that we have limited resources and the condition of the ST/MEGA market does

not warrant the additional resources (to say it nicely :-)).

Sincerely

I started the system from scratch, so I did not have to
convert anything. I do this as a test with all software that I
have any idea of running. I do SysOp our local club system,
which is running STadel 3.0(c)st, and am well aquainted with STadels
workings. Fantastic program, I would never even think of running
any other program.

BTW. It's not a problem that I know of with the Mega systems,
but rather with the newer version of roms, that I will have to
await patiently for the next version to be released. Sometime
the end of this year they said.

4806. ***HELP*** Floppy gone crazy!?!?!

Newsgroup: comp.sys.atari.st
Date: 1988-08-01 06:42:00 UTC
From: Friesen@HIS-PHOENIX-MULTICS.ARPA
Message-ID: <880801064254.135611@HIS-PHOENIX-MULTICS.ARPA>
Source record: 251406

I just decided that the floppy I use to store my word processor files and some other misc. things, probably had a lot of files I could get rid of. I decided to take a look at them and see which ones to throw out. I had never noticed anything strange about this disk before (the only time I access the disk is from file selector boxes, and I always know exactly what I want) so I really hadn't "looked" at the disk. Well, I got the directory up and much to my surprise, there were many groups of two files with exactly the same name. I opened the files (they were DOC files so I could view them on the desktop). One of the files had zero K and the other seemed ok. I opened another file from another group of two with the same names. These files were both garbage. I opened all the files and many of them (not just ones that had "copies") were garbage. None of the information was recagnizable, and the ones that shared the same names, sometimes had the same data, and other times didn't. One file (which had originally been a letter to GFA) actually had a list of all of the files on the disk amoung a small amount of garbage! Most of the files were older and hadn't been accessed for a while, and my new files (I had written some letters just today) seemed untouched. I decided (in a state of panic) that this must be the work of a virus. I quickly pulled out the VKILLER.PRG and PENICLN.TTP. First I checked the disk with VKILLER, then engaged PENICLN. Accourding to VKILLER the disk was fine. I then did some file copies to a ramdisk, and then a newly formatted disk and, well I did a lot, but I think it should have taken care of the problem.

********Please if anyone has any info. on what could have done this, tell me, I am very scared!!! :=(<---This is a crying sad face!

Thanks in advance

>also locks in on different places when I turn it on, as well as a skewed look
>in one corner.
>
>John

When I first set up my 1040ST w/SM124 monitor in my office and booted it, I was immediately greeted with a jittery monitor. Moving the system around on my desk helped somewhat, but only somewhat. Suspecting that my monitor was faulty, I borrowed another SM124, but to no avail. Sometimes the jitters were worse and sometimes better, but always present.

Must be RFI from somewhere, right? Sure enough, on checking I discovered that my monitor jitters were at their worst when other people were running small electric heaters in their offices. Only problem was, the nearest heater was more than 30 feet away; and when I plugged one of the heaters into a wall socket in my office, it didn't make much difference unless I parked the bloody thing right on top of my monitor!

So I checked to see if the electrical circuits feeding the other offices were buried in the wall near my system. Nope, no wires buried in the walls.

"OK," says I to myself, "then those crummy little heaters must be kicking up some line noise that my SM124 doesn't like." So I got the local electricians to install an isolating transformer on the circuit in my office. Didn't help.

By this point I'd pretty much resigned myself to living with the jitters 'til the warm weather appeared and the heaters were put away for the summer. (Small comfort in Halifax, since it doesn't get warm until June or so!) Then one day on the way in to work, I found the solution staring me right in the face: there on the wall of the Philosophy House, right outside where my office was located, and not three feet away from my desk, was the electrical service and power meter for the entire department.

Since there wasn't any easy way to move the electrical service, I moved into a new office when one became available. I'm happy to report that my SM124 is now rock-solid.

So what was happening? My guess is that the SM124 is pretty well shielded from RFI, but is quite sensitive to magnetic fields. Maybe I'm wrong about this (could someone who knows more than I about such things please comment?), but there's no doubt that those invidious little heater fans were generating lots of RFI, and they didn't make a lot of difference unless they were right next to my monitor. When the

heaters were turned on, on the other hand, they were drawing considerably more current through the electrical service and meter, and this would increase the surrounding magnetic field considerably. Well, sorry to run on so long. When I related the gory details of this story to another guy who was having problems with his SM124, he checked outside his house, and sure enough, his system was set up directly opposite the electrical service. Maybe this info will help a few others who have so far been frustrated in tracking down the source of their jitters.

> little things you're afraid we may have overlooked, please MAIL to
> me with your ideas.

Since i can't get to you by mail ('pandora refuses connection' on every path i tried), i post this to the net.

I have found another nice "feature" in the ST-keyboard buffering routines.

First the scenario:

The old TOS (Blitter-TOS and previous ones) uses a buffer of 80 longs for buffering keyboard input on GEMDOS-level. Three variables control this process: 1. a counter, which is incremented on adding and decremented on deleting of a char
2. a head-pointer which is incremented after adding a char to the beginning of the buffer
3. a tail-pointer, which is incremented after deleting a char from the end of the buffer
Whenever the two pointers get equal, they are reset to point to the beginning of the buffer.
When the count of characters in the buffer gets 80, the console beeps and no char is added.

And now the problem:

When you are typing faster than the program reads (and have always <80 chars in the actual buffer between head and tail), the buffer overflows into user-RAM, because the head pointer is always incremented and never checked against the high end of the buffer. Conclusion: the ST crashes.

Is this fixed in the new ROM-code ???

I remember seeing a couple of switch boxes at last year's PCW show. One enabled you to have both of your monitors plugged into the box which then plugged into the ST and it had a switch to select which one you used. This is useful for me because I often have to swap monitors. The other box has one socket for a Multisync monitor (I saw a Philips 8873 connected to it and I was told that an NEC works fine). It also has a switch for whether you want Hi-res/Med-Low-res. The boxes were made by Josty. I can only remember there name unfortunately, although they did say that they would be marketing through normal retailers although I must admit that I can't remember ever seeing them in a shop (not that I've looked mind you).

Funnily enough, the SM125 looks absolutely identical (in EVERY detail except the case colour and Atari badge and the phosphor colour) to a friends monitor on his PC. It can display 700+ by 450+ (he uses some kind of Super-Hercules graphic card). Oh and one other thing, the volume control that is marked contrast on the SM125 (well, it is a contrast control symbol) does in fact perform contrast control on his monitor which leads me to believe that Atari SM125's are basically some standard monitor (although looks can be deceiving!!).

If I had to cite which country makes the best cars,
neither the U.S. or G. Britain would near the top of the list.

Germany (mercedes, porsche), Italy (Ferrari, Lamborghini), and Japan (cheap
reliable cars) would be my list.

American cars are getting better but the reliability is
still significantly behind Japan and Germany (Consumer reports).

Rolls Royces are a Joke (my opinion). Comparable to a Billion Dollar Barge,
they are big, heavy and slow, and are virtually indestructible.
They are years behind in the usage of state-of the art technology
both in manufacturing and design (why pay for hand-built when a
machine can do it better). In all fairness, RR's are a good investment
in a car, they hold their value well. Real estate does better though.

Mercedes has the best engineering in the world (from interviews
with engineers who work at American car companies), Porsche is not far behind.
Depends on what kind of car you want.

Sorry about a serious response to facetious messages but
American cars? Rolls Royces? Really!

If I had to compare computers with cars, IBM would be the Americans
(has most of the U.S. market with mediocre machines), The Mac would be
Honda (decent and sells a lot), and the Amiga would be Volkswagen (good
cars, higher performance in basic models, and more maintenance (The OS is
better but more complicated)).

The ST is undeniably the Hundai of the computer world. :-)

There aren't any computers that come to mind as Ferrari's or Porsche's.
Maybe a screamin' 25 MHZ 386. Computer technology just changes too rapidly
for me to associate it with such venerable names as Porsche and Ferrari.
You can't speak the name Intel (or Motorola or National) with the same
reverence as you can when you say "PORSCHE"!

When you say "Porsche", you've said it all...

From: bruce@ektools.UUCP
Message-ID: <1375@ektools.UUCP>
Source record: 251416

One of our user group members has been experiencing many problems with his keyboard on a 1040ST. After sending the unit back to Atari (twice !) he eagerly tried the machine when he got it back last week. When it didn't work (you can imagine how he felt :-) he called Atari one more time.

He got to talk to one of the factory engineers who finally diagnosed the problem. It turns out that some third-party joysticks (in this case, a Pro-Line joystick), has connections to the "reserved" pins of the joystick/mouse connector on the bottom of the keyboard. This problem will occur with any bottom-mounted joystick ports like the 1040 or 520STFM.

You might want to file this piece of "trivia" in the back of your mind in case you ever run up against a similar problem.

4817. Floppy drive connector?

Newsgroup: comp.sys.atari.st
Date: 1988-08-02 06:33:19 UTC
From: leo@leow.UUCP
Message-ID: <8808020633.AA19547@gort.cs.Buffalo.EDU>
Source record: 251418

Can anyone tell me what the part number for the floppy drive port connector on the ST motherboard is? Mine appears to be shot, apparently from the dozen or so times I've disconnected and reconnected my floppy drive. Several of the female pins appear to be broken off inside the connector. The cable tests OK. I am still working off my hard drive, but doing so without a current backup gives me the willies. I got bitten by a no backup situation once, I'd hate to see it happen again for lack of a connector. Also, anyone care to venture an opinion on wether or not this is worth it? Is it likely to happen again, should I just hardwire the cable to the mother board?

Please respond via e-mail. Thanks in advance!

4818. STadel upgrade

Newsgroup: comp.sys.atari.st
Date: 1988-08-02 07:48:14 UTC
From: to_stdnet@stag.UUCP
Message-ID: <546@stag.UUCP>

From: thelake!steve@stag.UUCP (Steve Yelvington)

I chatted with David Parsons (orc), the author of STadel BBS,
a few minutes ago and he gave me some information on the
upcoming version 3.3a (shareware).

It probably will be released to a couple of beta sites in
the next few weeks -- assuming he can get to a working ST
to compile it. His 1040 has officially died and he's sold off
the hard disk. Development is proceeding on a PC clone, however.

3.3a will be able to network with other STadel/STadel-PC/Citadel-86/
Citadel-68K/Amidel systems using xmodem, ymodem or wxmodem, depending
on the net partner's capability. Wxmodem should greatly improve
performance when netting via PC Pursuit. The Citadel network now
stands at 52 nodes, including one run by Atari Corp. (408-745-2051).

UUCALL, the STadel/UUCP networker, is being reworked toward
full uucico compatibility. It will not be distributed with STadel
and may be sold through an existing software house. The portion
of UUCALL that integrates mail with the STadel message base will
be converted into a stand-alone rmail program so UUCP can do the usual
rmail commands to channel mail to BBS users.

4819. netlib@lakesys

Newsgroup: comp.sys.atari.st
Date: 1988-08-02 12:14:12 UTC
From: martin@lakesys.UUCP
Message-ID: <923@lakesys.UUCP>
Source record: 251417

We at netlib@lakesys.UUCP are very happy to see that we are fufilling a need on the net for an ST file server. Traffic is growing daily and the complaints of not being reachable are diminishing.

We have two requests of those who utilize netlib:

1) Please restrict yourself to no more than 5 file parts per request per day. Some have been requesting 20 or 30 file parts and it slows down the response time for others. It also strains our limited resources here. We have the capability to limit the number of file parts sent to any account per day with our software, but we'd prefer to rely upon your integrity. If there is no cooperation in this matter, then we will be forced to implement the limit in the netlib software.

2) Please be sure that you are using the correct syntax for file requests. If the file is in a volume, e.g. volume1. The volume # MUST be specified as part of the pathname for the file part in your request. Also be sure to put "from archives.atari" at the end of every file part in your request, otherwise the line is not parsed correctly and your request subsequently fails.

Thank you to all those who have been contributing to our archives, you have helped to make the netlib file server one of the best.

We appreciate your cooperation.

>> The symptom does not occur !

>I haven't seen this problem on the Atari, but I have seen it on other
>systems. (...)
>the wrong way? Maybe it needs repair? I use an old old monochrome

It sure does need repair. I had the same problem when I bought my Mega4 a few
months ago. I had a program that reversed the screen colors (to white on black)
cleared the screen, displayed the word "ONLINE" and waited for serial input.

The screen picture would break down completely, the "ONLINE" would vanish. Only
after something came in from the serial line, the picture would slowly reappear
and life would revert to normal.

I took the monitor to my dealer, and this is what he told me:

The problem is known. Atari manufactured a whole bunch of these monitors, but
refuses to deal with the problem, claiming that it is caused by 'unavoidable
parts tolerances'. Any monitor shipped to Atari would be returned unrepaired.

The problem, however, can be solved by internally 'tweaking' several adjustment
controls (you can see that I'm no EE). Since my SM124 was still under warranty,
he took it in, and ONE DAY later, it was fixed.

So: if your monitor is under warranty, see if your dealer can help you. If not,
get someone with a 'scope and the necessary knowledge to fix it.

I hope this helps.

PS: I am not commenting the attitude of Atari towards this problem, but it sure
does augment my prejudice against Atari marketing strategies.

4821. Laser C

Newsgroup: comp.sys.atari.st
Date: 1988-08-02 13:10:38 UTC
From: klute%trillian.irb@unido.uucp
Message-ID: <522@laura.UUCP>
Source record: 251421

After a few days of working with my new Laser C I stumbled over
some errors. Here they are:

1. LASER C doesn't work if GDOS is resident. The shell starts up
correctly but crashes as soon as a program is loaded.

2. In OSBIND.H a typedef is made for the 'disk transfer address'
used by functions Fsfirst() and Fsnext():

```
typedef struct {
char dta_reserved[21]; /* reserved */
char dta_attr; /* attribute */
unsigned int dta_time; /* time */
unsigned int dta_date; /* date */
long dta_len; /* length */
char dta_name[14]; /* name */
} dta;
```

On the other hand Fgetdta() is defined as
#define Fgetdta() (dta *)gemdos(0x2f)
which causes some error messages when Fgetdta() is used. To
overcome this the quoted typedef should be changed to

```
typedef struct _dta { ... } dta;
```

3. Conversion from double to float does not work for numbers
greater than 6.80564733841876989828278965 4E38.

4. The Resource Construction Program sometimes crashes in the
"Save" function. Redress: use the "Save as" function.

That's it so far. Any comments (Megamax)?

I am willing to compile a list of errors in Laser C. So if you
found out any more errors please report them to me by mail. I
will summarize to the net.

4822. nroff on st

Newsgroup: comp.sys.atari.st
Date: 1988-08-02 14:34:28 UTC
From: to_stdnet@stag.UUCP
Message-ID: <547@stag.UUCP>
Source record: 251422

From: thelake!steve@stag.UUCP (Steve Yelvington)

Shortly after I received version 2.0 of Mark Johnson's C compiler,
I went looking for code to compile to test it. One of the things I found
was a PD "nroff" for the IBM PC. It was pretty much self-contained
(didn't rely on esoteric library functions) so it compiled right off.

It seems to work just fine and it includes a couple of .MAC example
files. However, it's smaller and probably less complete than proff.
And, like proff, it doesn't support anything more sophisticated than
a vanilla printer.

I'll mail it off to lakesys (binaries and sources). Perhaps some wizard
would like to build on it.

4823. Re: Multisync Monitors on Mega ST

Newsgroup: comp.sys.atari.st
Date: 1988-08-02 15:43:37 UTC
From: dclemans.falcon@mntgfx.mentor.com
Message-ID: <1988Aug2.084339.10162@mntgfx.mentor.com>
Source record: 251423

You can very definitely use a multi-sync monitor on a ST as
both black/white and color; I've been using a Sony CDP-1302
multi-sync for over a year. The only "oddity" is that you
will probably have to build your own cable. I've also heard
of people using Thomson and NEC multi-sync monitors.

To switch between modes, you either ground the monochrome
detect pin (for black & white) or leave it floating (for color).

Message-ID: <7475@trwrb.UUCP>
Source record: 251424

I remember a little while back, netters where complaining about Atari forcing dealers to purchase $10,000 worth of parts. I now have more appreciation for what Atari may have been trying to do. In my area, it is difficult to find an Offical Atari Dealer that will do repairs. (I live in Los Angeles, CA) There are many so called "Offical Atari Dealers", but they do not do repairs. Apparently, once these dealers depleted their stock of parts, they decided not to do repair work.

I spoke with Atari on the phone. I told her my dealer does not do repairs. When she gave me a list of dealers in my area, she told me she did not know which dealers are doing repairs and which are not.

My options where 1)Find a repair dealer in my area. 2)Send my machine to Atari 3)Let my dealer send my machine to Atari

I found a dealer in Belflower.

["Big Time Television, where two's company and three's an audience."
- Max Headroom]

Since people seem to be porting ARC over to the ST and making mods to it anyway, why not add a buffer that allocates as much memory as it needs for the compressing/decompressing process so it will speed it up?

There is a program (sharware) called DCOPY by Ralph Walden that does this very thing but it's attached to a menu driven shell that does a lot of other stuff I could do without.

Anybody willing to try it?

4826. Questions about ST Video Ram

Newsgroup: comp.sys.atari.st
Date: 1988-08-02 17:44:25 UTC
From: brenes@skywest.UUCP
Message-ID: <535@skywest.UUCP>
Source record: 251426

Hello, this is a question to the ST graphic 'gurus':

I've written a program which is capable of generating a full screen (640 x 200) at a high rate (approx. refresh rate). Thus I have a NextScreen[32k] buffer which I use as a secondary video buffer. The idea behind it is to ping-pong between this NextScreen[] buffer and the one that the ST assigns for the Video, by changing the physical address from which the Shifter expects to find the video information. In this way I save the time consuming operation of moving data from NextScreen[] to the video buffer for display.

The problem that I have is that every time I call the XBIOS routine SetScreen(logadr,phyadr,rez), where phyadr = &NextScreen[0], the screen jumps horizontally left to right. The information displayed on the screen is correct but is skewed to the right 3/4 of the screen (BTW, the program is written using MWC 2.x). What I've noticed is that the video buffer that the ST starts with is located in a 32K boundary, 0xf8000, while the starting location of NextScreen[] is not. It also seems that if a take &NextScreen[0] mod 32K, the remainder is the offset that I see on the screen. So, the question is: If the Shifter expects the video ram to start at 32K boundaries, then how do I get MWC, or any C program to allocate a 32Kb buffer starting in a 32Kb boundary in an efficient manner? An initial thought was to use Malloc() to allocate 64Kb and then only use the 32Kb which start in a 32Kb boundary, but this method is too wasteful. There's got to be a better way, isn't there?

Any suggestions will be welcomed.

Erasmo.

4827. software/hardware for sale

Newsgroup: comp.sys.atari.st

From: cochrane@spot.Colorado.EDU
Message-ID: <2464@boulder.Colorado.EDU>
Source record: 251427

A friend of mine has sold his ST and wants to sell the ST software programs that he still has. He also has a couple of pieces of hardware to sell. He is willing to take best (reasonable) offer for these. Here is the list:

SOFTWARE Sale Price

Balance of Power (color system) $25
Flight Simulator (color) 25
High Roller (color) 25
Time Bandit (color) 20
Sundog (color) 20
Flash* 12
Degas* 15

142

I believe he intends to give a discount if you purchase all of the packages listed above (Talk to him about the amount.). All software has been rarely used and includes all manuals and original boxes.

*These items include the original registration card (which he never got around to sending in).

HARDWARE Sale Price

Packard Bell 300/1200 baud modem $100
Citizen MSP 20 printer with parallel
and serial ports 250
Macintosh 64K ROM chips for
Magic Sac & 10 disks of
MAC PD programs 40

The modem and printer were also rarely used and are both in excellent condition.

BOOKS

Compute's 1st Book of Atari ST $7
Compute's St Artist 7
ABACUS Gem Programmer's Reference 8
Graphics & Sound 8
Tricks & Tips 8

38

A discount is also available on purchase of all the books listed above.

MAGAZINES WITH DISKS

Start 5 vols $20
Compute ST 8 vols. 25
ST Log 3 vols. 10

55

His name is Samten Nagarajan. He can be reached at:
home 303-442-8129
work 303-770-5004

3850 Paseo del Prado #9
Boulder, CO 80301

He is currently out of town and should be back around August 16th; but his wife should be able to answer some of your questions about these items. If you don't want to wait two weeks she'd probably be willing to ship an order out before he gets back. If you have questions about any of these items and wish to send me mail about it, I'll do my best to answer them.

4828. Re: nroff on the ST

4829. Carrier Command, help

Newsgroup: comp.sys.atari.st
Date: 1988-08-02 23:16:53 UTC
From: cmcmanis%pepper@Sun.COM
Message-ID: <62535@sun.uucp>
Source record: 251429
Cross-posted to: comp.sys.amiga,comp.sys.atari.st

Ok, I shelled out the bucks for Carrier Command, the battle simulation where you drive a carrier around, launch amphibious and airborne craft and attempt to stop an enemy carrier. I have some difficultly with it though. Since it came out for the ST first I have crossposted this to the st newsgroup but followups will go back to amiga since those folks are probably already familiar with this game.

So some questions :

1) You ``colonize'' islands by driving an amphibious craft onto them and dropping a "constructor". Great, no problem there. Unfortunately you have to drive the carrier over to each island to be close enough to get to the beach. Fine, except the carrier is slow, and it is running out of gas. End result, by the time I had set up the third island, the enemy carrier had colonized 24. Clearly there is something here which I am not catching on to. Then I had to sit around at the last island I had colonized waiting for my network to manufacture some Gas for the carrier. After a while the enemy carrier was bombing my other island (he now had 48 islands under his control). So there must be something I can do differently.

2) The controls on the craft are a joke, particularly because you use the mouse to steer as well as control your speed, but can't do both at the same time. Basically, you have to click it into and out of pointer mode to change what you are controlling (speed/direction) and while setting the speed the craft is often driving into oblivion. Yuck.

3) When setting up and controlling the amphibious craft (or airborne ones for that matter) each screen ``remembers'' the last craft your were looking at (you have 4 each). This can be a real pain when you are in the "loading" screen and loading on bombs and stuff and then switch to the hanger screen to leave the carrier *it switches the vehicle you are looking at as well*. The end result was I loaded up Walrus 1 and ended up driving Walrus 2 out the carrier and on to the beach only to find it didn't have anything on board.

4) When attempting to shoot ``cruise'' missiles from the carriers you have to launch a "viewing" drone to target the missle. Unfortunately when I do that the viewing drone is looking straight down at the ocean and not the island. As there are no interesting targets in the ocean I waste a drone. Not only that I *cannot* shoot anything on the island with a missle that way. And yet the

manual suggests that these missles are the only thing that can
penetrate a "command" center. So what do I do?

When I figure these out I am sure this game will be a lot more playable
but for now it is really frustrating.

Well, the boundary turns out to be a lot less than 32K: screen RAM must
start on a page boundary, which is to say screenram%256 == 0.
Thus you only have to allocate 32256 bytes, which you can most likely
afford. (Screen memory is 32000 bytes, not a full 32K.)

These are my opinions, and in no way reflect those of UCSC, which are wrong.

>better but more complicated)).
>
>The ST is undeniably the Hundai of the computer world. :-)

Bad analogies, I would say. The Mac is an overpriced machine with a bit
of sexiness and yuppie appeal. Perhaps like a BMW. The Amiga is hardly
a VW, since VWs are both very popular and quite reliable. The Amiga
is more like a Lotus - zippy, for hobbyists and needing lots of maintenence.

The Atari is like a cheap Citroen. Sells well in Europe, but not marketed
in the USA. But otherwise it is like that Korean car.

IBMs is impossible to place. It used to be like the Rolls Royce - solid,
slightly old technology that's expensive but very reliable and well
supported. But now they're the ones making innovations while the clones
stay put. (Innovations in the PC world, that is.)

> $800 or so price it had. Does that $149.95 price include a C compiler
> and so forth?

The $149.95 (US) price does NOT include the Whitesmiths C compiler. It includes the mulit-user, multi-tasking executive and the utilities (about 80 or so), standard drivers, and drivers needed to run STX-Windows (sockets, ptys, etc.)

IDRIS + WSL C + STX-Windows + Pascal + 68020 libs for the ST/MEGA is $600 (US). This is called a Professional System (PS).

>
> So, if Idris is really that cheap, maybe we should compare it to Minix.

>the compressing/decompressing process so it will speed it up?
>
My intent was simply to port the MSDOS program, making as few changes as necessary to get a running program. The idea is to make everything look as much like the original as possible. Of course, we don't have people like Phil Katz writing 68000 assembly code for the ST just yet, so lumping in PKARC compatibility into this program seems like a reasonable thing. Gratuitous modifications probably aren't the way to go. At least, not if you're going to call your program "ARC" of any form or another. (Look what's happening with Katz - he's got a lawsuit to worry about now.) In any case, I'm not sure that a large buffer will be such a speedup. I'd expect that it buys as much speedup as simply using a large enough RAMdisk. Running my system on a 1.4meg RAMdisk, I can say that it's godawful slow. I don't think throwing more memory at the problem is the solution.

>There is a program (sharware) called DCOPY by Ralph Walden that does this
>very thing but it's attached to a menu driven shell that does a lot of other
>stuff I could do without.
>
DCOPY is kind of nice. I still don't think the buffer buys too much, but what the heck. I think the basic idea is right - if you want it faster, rethink the algorithms, and code it in assembler. I haven't had time yet to look up all the background theory & such behind it, though I plan to. So far I've paid as little attention as possible to the fundamentals, trying to locate all the nitpicky superficial details. Ralph Walden seems to have the background down. I bet it's not going to be long before we see a new ARC-compatible utility for the ST that runs at a respectable speed. I agree on that point - I don't want all the other functions DCOPY has. Just a fast ARC... I've never been too eager to jump on it though, knowing there are other people out there already working on it.

>Anybody willing to try it?
>
>Russell Schwartz ["This is another fine myth you've gotten

>voice: 503-643-2786
> BBS: 503-292-1321 (Sysop @ IBBS - FoReM Node #4 - 3/12/2400 - PCPursuitable)

Just a matter of time, I'm sure. In the mean time, it'd probably be a good idea to start thinking about more advanced archiving methods. I think the good ol' Unix(tm) tar & compress utilities are perfect. Port PDtar, latch onto a decent C compiler that can handle arrays of 320K and up, and hey - fast compression, plus full directory hierarchies.

Something to consider, at least. ARC is nice, but it shows its CP/M heritage too well - designed for a flat filesystem. Sure MSDOS has evolved beyond CP/M now, but a lot of that design philosophy still shines thru, and it'd be a terrible thing to saddle down a sleek machine like the ST with that kind of anachronistic burden...

[stuff deleted]...

Note that this doesn't have to be the work of a virus. It is perfectly possible in GEMDOS to have two files with the same pathname (whether this is desirable or documented is another question: you get lots of problems deleting or accessing one or the other).
I did something like:
0) Start first program
1) first program opens the file readonly
2) Pexec second program
3) second program opens the same file write-only
4) writes into the file
5) closes it and exits
6) first program closes file and exits
and then I had two copies of the file. The program in question was in fact a 'more' utility which can fork a 'vi'; this option I no longer use because of the duplicate files problem.

Perhaps you have an analoguous problem; for instance if your shell for some reason keeps files opened (e.g. shell scripts, files to which redirection is done) you will encounter the same problem.
I suggest you check all your tools and programs for weird behaviour by keeping constant track of the contents of your directories for a while.

Hope this has put you at ease somewhat - it could still be a virus 8-).
Happy virus-hunting!
Leo.

4837. New ST ROMs

Newsgroup: comp.sys.atari.st

From: neil@cs.hw.ac.uk
Message-ID: <1926@brahma.cs.hw.ac.uk>
Source record: 251437

Question for Allan Pratt (Atari) but is of general interest (?) so here it is
netwide:
Will Pexec() in the new ROMs be able to run a program that has its hidden or
system bit set in the file attributes? I used to think that hiding ahdi.prg or
accessories on our hard drives would stop the students trashing them but Pexec
just ignores them. I can understand that when running \auto programs and
looking for accessories that sfirst() anf snext() are used with some attribute
but I can't seem to get one hidden program to run from Pexec() explicitly.
Am I missing something (that's my insurance statement :-) or is this a failing
in the old ROMs (that's the possible flamable offence :-).

>

Like the summary says, the address needs to be evenly divisible by
0x100 (some people claim 0x200, but I've never had problems with 0x100). The
method for this fairly simple:

```
char NextScreen[32256],*NSPtr;
```

somewhere down the line:

```
NSPtr = (NextScreen & (~0xff)) + (((NextScreen & 0xff) > 0) * 0x100);
```

This code flat won't work, as MWC doesn't allow anding an address
(last time I checked, anyways), so you just cast NextScreen to a long in the
line above (or use a temporary variable, or whatever toggles your fancy).

The second half of the line takes care of the problem of just using
the &. However, if I remember correctly, the line will be faster than using
a mod - this should probably be checked out via diassembly...

You have just found one of the more bothersome bugs in GEMDOS.
When GEMDOS opens a file for write it sometimes fails to delete the
current file first. This means you can end up with 2 (or 50 for that
matter) files with the exact same name. Most people won't notice that
this has happened since the standard desktop code won't display
duplicates (the sort routine used in DESKTOP.APP deletes duplicated
entries). Some shells will show duplicated files, some won't.

FIXES: Find a shell (eg. Micro C-Shell from BDT) that will
rename a single file, not all files with the same name. Rename each
duplicate to a scratch name (eg. dup1, dup2, etc.). Then look at each
copy and decide whether or not to keep it. Delete all the unwanted ones
and rename the one you kept back to the original name.

PREVENTION: there is *no* 100% sure way of preventing this from
happening. It is distantly related to the "40 folder limit" (common
data structures are used for folders and files; sometimes GEMDOS will
create several entries for a single file or folder which can lead to
duplicated files). I would really suggest using GEMBOOT, it checks the
number of folders online and creates enough entries for them in the
table. The next best solution is FOLDERXXX.PRG which allows you to add
any number of additional entries to the table. Finally, reboot on a
semi-regular basis. That lets you start over with a "virgin" machine,
which is more likely to work correctly.

I'd also suggest looking at your disks at least once a day (if
you use the machine a lot) to check for duplicated files. It's also a
good idea to run a disk test program on a regular basis. Dave Small and
I wrote one called CHK that was published in ST-Log a couple of months

ago. There are others that seem to work pretty well also. These
programs will check for errors in the file system on the disk and then
give you a status report based on what they find. Very similar to what
CHKDSK does for MSDOS.

Me no graphic-guru, but as far as I know the buffer has to be aligned on a
512 byte boundary, so Malloc() is wasting only up to 511 bytes.
Hope thats correct, i haven't tried it yet:-)

>is written using MWC 2.x).

The documentation states that the display buffer must be aligned on a
256-byte boundry. There is an example in the MWC manual that shows
how to do this. I believe it is the example for Setscreen, but I do
not recall for certain. Essentially, you must allocate a 32K-plus-
256-byte buffer, then round the screen base address up to the nearest
256-byte boundry, like this:

```
long alt_screen; /* Alternate screen address */
long mem_block; /* Place to keep original address of
buffer, in case we want to Free() it */

/* Allocate memory for an alternate screen buffer */
if ((mem_block = (long)Malloc((unsigned)0x8100)) == NULL) {

/* Handle out-of-memory error here */
}

/* Round the address up past the next 256-byte boundry, then
zero the low-order 8 bits. This guarantees that the
address is both within the block we allocated, and at the
proper alignment. This can waste 256-bytes, worst case. */
alt_screen = (mem_block + 0x100L) & (~0xFFL);
```

If the returned address from Malloc() was already properly aligned,
then the wasted 256 bytes will all be at the start of the block. In all
other cases, the wasted space will be split between the beginning of
the block and the start of the screen, and the end of the screen and
the end of the block. If you are that desparate for memory,

```
alt_screen - mem_block
```

is the number of bytes wasted before the start of the screen and

```
256 - (alt_screen - mem_block)
```

is the number of bytes wasted past the end of the screen.

In article <535@skywest.UUCP> brenes@skywest.UUCP (Erasmo Brenes) writes:
[some lines deleted]...
|The problem that I have is that every time I call the XBIOS routine
|SetScreen(logadr,phyadr,rez), where phyadr = &NextScreen[0], the screen jumps
|horizontally left to right. The information displayed on the screen is
|correct but is skewed to the right 3/4 of the screen (BTW, the program
|is written using MWC 2.x). What I've noticed is that the video buffer that
|the ST starts with is located in a 32K boundary, 0xf8000, while the starting
|location of NextScreen[] is not. It also seems that if a take &NextScreen[0]
|mod 32K, the remainder is the offset that I see on the screen. So, the
|question is: If the Shifter expects the video ram to start at 32K boundaries,
|then how do I get MWC, or any C program to allocate a 32Kb buffer starting in
|a 32Kb boundary in an efficient manner? An initial thought was to use Malloc()
|to allocate 64Kb and then only use the 32Kb which start in a 32Kb boundary,
|but this method is too wasteful. There's got to be a better way, isn't there?

The shifter does not expect the video ram to start at 32K boundaries.
The restriction for the start address is that it has to be a 256 byte boundary.
The top byte of the long that contains the start address (the least
significant one, bits 0-7) is ignored, as is the low byte (the most
significant one, bits 24-31) of course because of 24 bit wide
addresses. top -1 goes to 0xffff8201, top -2 to 0xffff8203.

If you use Malloc():

```
long memptr;
extern long Malloc();

memptr = (Malloc(32000 + 256) + 255) & ~255;
```

should do the trick (can fancy it by checking whether Malloc returns
out of memory, and/or by saving the return value for a possible
Mfree()). Note that a screen fits in 32000 bytes, that's less than
32K. The overhead is the extra 256 bytes.
Adding 255 and dropping the lower 8 bits with & ~255 will ensure that
memptr will have a value between that returned by Malloc and 256 more
than that value, and that the LSB of it is 0.

|Any suggestions will be welcomed.
|
|Erasmo.

Hope this helped.

Leo.

From: gibson@trwrb.UUCP
Message-ID: <7488@trwrb.UUCP>
Source record: 251445

I am in the process of replacing the power supply on my Atari Harddrive Sh 204. The old power supply has two sources for +5VDC and two sources for +12VDC. Each +5VDC and +12VDC line is separately connected to the disk drive. One +5VDC line and one +12VDC line is connected to the logic boards. One +5VDC line and one +12VDC line is connected to the drive mechanism. The new power supply has higher amp rating. Is it necessary to separate these connections?
Thank you for help

>

Actually, I think you need to allocate the screen on 512 byte boundry. The
reason for this if the shifter is missing the lower nine bits of it's
screen base pointer. (It could be 8 bits and 256 byte boundry) Anyway
try this.

```
unsigned char screen[32512];

long scrtemp;
unsigned char *scrptr;

{
...
scrtemp = (long) screen;
scrtemp &= 0xfffe0000L;
scrptr = (unsigned char *) scrtemp;
...
Setscreen(scrptr,scrptr,0) /* set screen to low resolution */
...
}
```

Maybe not 100% correct but I sure it is closer to what you want.

4848. Another great quote from Mr. Good

Newsgroup: comp.sys.atari.st
Date: 1988-08-03 18:24:24 UTC
From: med@druhi.ATT.COM
Message-ID: <3308@druhi.ATT.COM>
Source record: 251448

From Computer Shopper August 1988, page 214:

"Atari to Release Fourth Edition of TOS"

.....

In an exclusive interview, chief TOS developer Roy J. Good stated
that many planned improvements had to be cancelled due to lack of
downward compatibility with applications written for the older TOS.
Specifically mentioned was the update for the GEMDOS function
malloc ($48), which is used to allocate memory for applications.
Many programmers had written their own code to overcome the
deficiencies of the older malloc, and this code will not run
properly with the newer malloc in place. Roy Good called programs
containing such code "misbehaved," products of "just flat-out bad
programming."

.....

Flame On

Seems to me that this is another instance of the pot calling the
kettle black! Atari, and their bug riddled malloc code (I should
really include all of TOS here, since it's all pretty full of bugs),
admonishing developers for fixing malloc any way they could. If it
didn't take Atari 2+ years for each new version of TOS to hit the
streets, maybe these developers could wait for a fixed version of
malloc. I guess I really am taking exception to Roy J. Good being
the "chief developer", since he really hasn't even been there a year
yet. I really don't think that he has a clue as to what happened between
the developers and Atari in those earily days. Some expert...

Flame Off

Just so I don't leave you without some good news, the rest of the
article was very informative. It describes the fixes that are being
included in the new version of TOS. Maybe I'll see one by Christmas
1990...

for all you ST owners in the toronto_ont_canada area, you might want to avoid having anything to do with a company called "MicroD". i just had a seriously unpleasant experience with them.

background: my hard disk gave me an error when i was re-formatting it the other day ("HARD DISK ERROR!!! CLASS 3 CODE 0"), and made THAT noise, the one every HD owner has nightmares about hearing

BBBBBBBBBBBBRRRRRRRRRRRRRRRRRRAAAAAAAAAAAAAAAAAACCCCCCCCCCCCCCCCCC!!!

argh! do another format, same error, same noise. now when the drive starts up it makes the noise, and data is corrupted on 2 of the partitions.

cut to: today, anxious user calls people who sold him the drive (the University of Toronto Computer Store), and after the usual being switched from phone to phone/spending my summer on hold, I get the name of the distributor, one "MicroD" by name, look up the number and call.

(now i don't know what may have happened to this woman before i called her, perhaps her cat was run over, but this is a transcript of the conversation)

ME: Hello, I'm the owner of a sick supra hard disk and...

HER: YES, I KNOW! I'VE HAD THREE CALLS ABOUT YOUR HARD DISK SO FAR, AND I'M NOT GOING TO DO ANYTHING ABOUT IT!

ME: I beg your pardon?

HER: YOU HEARD ME! I DON'T KNOW WHERE THEY GOT THE DAMN THING, BUT IT ISN'T ONE OF MINE, AND I'M NOT GOING TO TOUCH IT. THERE ISN'T ANYTHING IN IT FOR ME.

ME: But...

HER: How long ago did you buy it?

ME: 2 or 3 months.

HER: Oh. Do you have a receipt?

ME: Yes, of course.

HER: Oh. Well, that doesn't make any difference. I don't know where they got it, but they didn't get it from me and I'm not going to touch it because I'm not going to make anything on it.

ME: Can you fix it anyway? That is, if it isn't on warranty, and I pay you?

HER: NO!

ME: Why not?

HER: (more of the above. ie. not worth it to me, not my problem, ...)

ME: Well, I'd thank you, but...

HER: Same to you. goodbye! <CLICK!>

Now, I've never talked to this woman before. I never called her up and gave a rough time, nor threatened her with legal action, or given her any cause to vent her spleen upon me. All I have is a sick hard disk and I want to find somebody that will fix it for me. I can pay, no problem. As for her three calls, I have no idea what she's talking about.

A few minutes later, another chap from the UofT calls me up and we converse about who can fix HDs in Canada. Turns out he called her up too and got an earful. I don't think either he nor I will be calling up that company again. But I did call Supra and talk to Mark in technical hcr, and get an infinitely warmer response, so hats off to Supra.

It'll be a long time (read: THFO) before I have anything to do with MicroD in any way, shape, or form. For those of you that were considering it, or considering buying a HD from somebody who gets theirs from MicroD, well, I just thought I'd warn you.

4851. Termcap description of Atari ST

Newsgroup: comp.sys.atari.st
Date: 1988-08-03 21:46:24 UTC
From: hyc@math.lsa.umich.edu
Message-ID: <393@clio.math.lsa.umich.edu>
Source record: 251351

Apparently a lot of people have gotten hold of archived copies of my port of Larn 12.0 that were missing the termcap file. It seems to be useful enough in a wider sense that I'm posting it again. If your version of termcap supports the "tc" capability (most Unix versions do, most PD versions don't) you can replace the st52l description with ":li#50:tc=st52:"

This is what I use with the CWRU Zmodem package when I log in to a Unix system, and is also good for the KA9Q TCP/IP package, as well as any other dumb terminal style communications you need to do. If there's sufficient interest, I can also post the description I've written for Uniterm.

This sounds like the Fcreate bug that Allan Pratt addressed some time ago.
I was actually going ask if this is fixed in the new ROMs but I guess it
is since he knew about it.
The problem is that Fcreate doesn't check to see if the Fdelete it does to
remove the old file is successful and goes and makes another file.
Being the foolhardy git that I am I would storm in there weilding a disk editor
and change the names of the duplicate names directly. Re-open the disk and
save what was useful.

the ripoff element in this game really gets under my skin:

> (the enemy carrier now had 48 islands under his control). So there must be
> something I can do differently.

You could try selling your copy to someone else. Seriously though the technique
is something along these lines but try various combinations.

Restart the game. NOTE: A strategy game or you will never get any fuel. (BUG!)
Go straight to the island named 'Isolus'.
This takes some time so build an extension on your house while your waiting.
When you get there shave, then put a base on the island. Move just out of range
of the island and wait for the enemy carrier to attack the island then breeze
in there and blow it to smithereens. Simple. The carrier puts up little or no
resistance at all.

> 2) The controls on the craft are a joke ...

The game is a joke.

>When I figure these out I am sure this game will be a lot more playable

>question is: If the Shifter expects the video ram to start at 32K boundaries,
>then how do I get MWC, or any C program to allocate a 32Kb buffer starting in
>a 32Kb boundary in an efficient manner?

The video RAM address must start on a 256 byte boundary. To be sure that your
buffer is on this boundary try this: (Forgive any lack of style)

```
if ( (buffer=malloc(32256)) == NULL) /* Get memory */
{
fprintf(stderr, "Not enough memory\n"); /* Or bust */
exit(-1);
}

screen=(buffer+256) & 0xFFFFFF00L; /* align on boundary by */
/* by leaping 256 bytes */
/* into buffer then */
/* clearing lowest bits */
```

If you want loads of screens you just malloc that many times 32000 and add 256
for allignment.

```

>any bottom-mounted joystick ports like the 1040 or 520STFM.

It's not only 3rd-party joysticks, and not just bottom-mounted ports. I've had a problem with my 520ST (side ports, no builtin floppy, originally no TOS in ROM) for years, in that if I booted the machine with my **REAL** Atari brand joystick plugged into the second port, the keyboard would not work. Since I didn't have much joystick sortware, I simply left it unplugged until it was wanted. Finally, I got bored with that and opened up the joystick -- lo and behold, it had 'forbidden' connections as well. When I detached them and fiddled it back together, the problem was gone.

If Atari can't make their own joysticks right, it's not surprising that the 3rd-party people have problems. (Admittedly, mine was the stick from an Atari 8-bit machine -- don't know about them but maybe they make use of the slightly different connection.)

>to allocate 64Kb and then only use the 32Kb which start in a 32Kb boundary,
>but this method is too wasteful. There's got to be a better way, isn't there?

You've got the concept right, but not the detail. The video buffer must
start at a location which is 0 mod 256 (or is it 512, and I'm wrong again?
anyway, doesn't matter, fits into 32K regardless). The video buffer is
32000 (exactly, decimal) bytes long. So, allocate 32K (32768 decimal) and
then start your buffer at the first location therein which is 0 mod 256.
Tiny bit of waste, but...

4859. GEM on Unix Box?

Newsgroup: comp.sys.atari.st
Date: 1988-08-04 09:27:39 UTC

4860. Re: How often does a typical laser printer Jam?

Newsgroup: comp.sys.atari.st
Date: 1988-08-04 09:46:25 UTC
From: pes@ux63.bath.ac.uk
Message-ID: <2885@bath63.ux63.bath.ac.uk>
Source record: 251360

Occasionally you find a rogue laser printer (or photocopier, which uses the same sort of feed mechanism). However, usually (very usually) the problem is 'user error'. The beasts are fussy about how their paper is loaded. Not surprisingly -- the mechanism required to pick 1 *one* 1 exactly sheet of paper from a stack time after time is very fiddly. So, follow the loading instructions exactly. Square up the paper stack neatly. Anything that needs to be slid against one edge or the other should be, as precisely as you can manage but without forcing it.

Other hints:

1) Don't mix paper. Run it until it is empty and then put in a new full stack. If you want to refill it before it is empty, throw out (or save for later) the remnants of the old stack. Adding new paper to an old stack is asking for trouble.

2) While us humans might not notice the difference, printer feeders often care which side of the paper is up. (I think this is related to which way it was curled on the roll before it was cut into sheets and packaged.) Paper-making technology is such that if you stick with one brand of paper, it will be consistently packaged at least -- so once you've worked out which is the right way up relative to the top of the box, or the seam side of the wrapper, or whatever, stick with that. If you find a stack giving real trouble, try unloading it and putting it in other side up.

3) Paper dimensions vary with humidity by a surprising amount, so try to find somewhere for your printer which provides as stable an environment as possible.

We're looking for an adapter board that will allow us to plug a 68030 into the 68020 socket on our VERSAbus processor boards. The processor boards are Motorola VM04's, if that's of any help, since I understand that there are various levels of adaptation possible. We were wondering whether anyone makes such a board commercially, because we don't want to have to (yuck) wire-wrap a small board with 150+ pins on it.
Thanks in advance,
Crispin

It sounds like the TOS directory structure and FAT tables are corrupted.
If you know the layout of TOS disks, you could use a low-level disk
editor to try to repair the damage.

Plug Warning: The program Hard Disk Sentry will fix these sorts of
problems on floppy disks and hard disk (worse on hard disks becuase
there are a lot more files at stake). It retails for $49.95. Sentry
also optimizes (un-fragments) files too.

Well...

Make sure there are no random power supplies (like from disk drives, etc.)
near your monitor; they can cause an ST mono monitor to get jittery. And
of course move any other power supplies (i.e. don't charge your car battery
nearby :-)

In my experience, I haven't had jamming problems with the SLM804 I've been
using here for many months; in fact, mine is a very early SLM804, and has led
full and productive life. No plans for retirement yet.

There are occasional mishaps, but as long as the paper is loaded correctly,
and it wasn't crumpled into a little ball and then stuffed into the paper
tray, it works fine. I feel perfectly happy starting the machine doing a
>50 page printout and walking away.

> Well what about laser printers. Do they often jam, or is it rare?

I forgot; I should define what I mean by "jam". A little red light with the
international "paper jam" symbol comes on, and the printer stops and waits
patiently for you to clear the paper path (no big deal.) I have never seen
an SLM804 actually EAT anything, or grind it up into little tiny shreds, or...

You get the picture :-)

In response to the article about MicroD - I have dealt with them in the
past and found them to be extremely reasonable. I have also dealt with
Idiots at the U of T computor store and found them to be very unhelpful.
They would pass the buck to any distributor they could and not support
any products very well.
I can understand the response of MicroD. They are just a distributor
and U of T isn't a customer of theirs. Why should they support UofT's
customers then?. Rudeness is one thing, but if you had people calling
up to get support for a product you didn't sell - wouldn't you get pissed
off.
Retailers are there to support products - thats why they make a 35-50%
markup on products. Distributors make on average 10-20% because they
are there to deal with retailers - not the public.

I've seen the same thing; if you can't find an obvious cause for the jitters, try moving the system around a little. At least once, on the road, I've had a monochrome monitor jitter near one point of a wall in a meeting room and be rock solid elsewhere; the best theory we had was that there were some heating and air conditioning control stuff for the meeting room in the wall, and they gave off enough of a magnetic field that the monitor got jittery.

The monitor may BE the same (the SM124 is essentially a Goldstar
monitor, I think), but the interfaces aren't. IBM PC and Hercules
monitors run off a TTL interface. The ST mono signal is a composite
video signal.

4874. 1040ST + ALOT for sale...

Newsgroup: comp.sys.atari.st
Date: 1988-08-05 01:28:47 UTC
From: rubin@Apple.COM
Message-ID: <15189@apple.Apple.COM>
Source record: 251374

The following will be for sale in the VERY near future. I
am not sure exactly what I should ask but I have a good idea
as to what I want, so offers will now be accepted:

Atari 1040ST with 2 Meg ram, built in DSDD drive and updated
TOS in EPROM, mouse, keyboard, midi interface, etc.
Additional SSDD external floppy drive.
BOTH Color and Monochrome monitors.
"Monitor Master" monitor switch.
Fujitsu 80MB hard drive with Adaptec controller and Berkeley
Microsystems interface card. (100% Atari compatible and
uses Atari's Hard disk utilities and disk drivers)
Epson FX-85 printer (less than 1 year old here!).
Hayes 1200 modem and a VERY long modem cable (the real Hayes!).
Solid Oak monitor and disk stand (holds HD, floppy on shelf and
both monitors on top with room to slide the computer underneath).
Registered copy of the CURRENT Mark Williams C compiler with source
code debugger. (I will have the reg. transfered)
Magic Sac cartridge with MUCH software (Macintosh emulator)
IBM PC-Xt emulator program with software.
MANY MANY games (in original boxes).
Many other programs that seem to collect on a hard disk! (PD and
such).
FULL GEM documantation. Full Atari Developers documentation (all
in binders), plus a number of books on the ST system.

Reason for selling: While still loyal to Atari (I worked there almost
9 years), I now work for Apple and I no longer am using the system.
It is just sitting idle and I would like to see it put to good use.

Offers should be made to rubin@apple.com or by phone at (408)973-4928
during the days and (408)365-8109 evenings and message. Leave your name,
phone number and a price offer. Local people to the San Francisco bay area
I can deliver, others should include shipping. Note that MOST original cartons
have been retained. Most original reciepts are also avaible for your viewing
pleasure.

-Owen- (rubin@apple.com)

Not quite right. As I know, (would be more logical) the video bitmap graphics
array must start at a page (256b) boundary. So, substract #256 from all values
given by Jan-Hinrich and it will be ok, I guess ...

With my best wishes for your success -- alderaan.

Hi!

I have laid my hands on an ESDI disk, which I would like to interface to an atari ST. However, being out-of-hardware for several years now, I'm having some questions:

1) What exactly is ESDI? Where can I find the spec, who can recommend a book or an article on this subject?
2) How does ESDI relate to ST506/ST412? and to SCSI ??
3) I know how to interface a disk with a ST506/ST412 or SCSI interface to the ST. Is it doable to convert ESDI to either of these?
(Big wish:) Anyone by any chance aware of affordable boards to do this? Magazine articles ??
4) Is it doable what I want to do? Any advice, help, hint etc. is very very welcome.

(FYI: the drive in question is a Micropolis 1355)

Any response is greatly appreciated, and many thanks for your help!!

>

The program that you want is called FLEXCESSORY. This is a program that allows you to load programs into the DA area and keep them there. They describe it as being able to load accessories, but this is not really true, what it loads is .tos and .gem programs and keeps them resident in the DA area. The accessories that they speak of are DA's that have been converted to .tos and .gem.

Looking at the review, it looks very nice. It can load programs, unload some or all programs, and save the configuration.

The price is $29.95 from the E.A.Brown catalog (This is the only place I have seen it).

If you want to see the review yourself call and ask for catalog #E18, which I guess is number 18.

I'm putting together a Public Domain archive site for rutgers. It will be housed on a Sun 3/180. The material that will be stored will be obtained from other sites on various networks, using ftp. These archives will include INFO-MAC, the MSDOS collection at Simtel20 (as long as my ARPA connection is around) as well as others. I want to be able to update my collection by getting the new files every night. I want some sort of script or program that will do this automatically, by comparing what I currently have to whats on each particular archive site. Is someone already doing this type of thing on a Unix machine? I don't want to reinvent the wheel. But if I must, I will.

Please reply directly to me as I don't read all of the newsgroups I have posted to.

Thanks,

Mike

> From Computer Shopper August 1988, page 214:
> [deleted]

Please, please, please do not take quotes in a rag like that as Gospel.
There were at least half a dozen howlers in that article, and this was
one of them.

The truth of that "quote" is this:

I tried to fix Malloc so there would be no limits on
the number of blocks you could have around, by using
the memory above and below the block to keep track
of the blocks themselves. I had to back out this
improvement, because lots of programs violated
the commandment:

Thou Shalt Not Screw With Memory Thou Ownest Not

The Malloc you will get in the new ROMs is vastly
improved, but still has limits because I was forced
to go on using the OSPool. The OSPool is statically
allocated with a fixed size. It is still expandable
with FOLDR100.PRG, but the fact remains that it can
be filled up.

So the summary is, "There were some improvements we tried but had to
back away from because of ill-behaved programs."

Another of those improvements was getting rid of clearing memory before
launching a program. In 11/20 ROMs (pre-Mega), the code which did this
was REALLY SLOW, but only had a max of <1M to clear. For a Mega, Landon
Dyer sped up the code, but it now has a max of just under 4M to clear.
This takes a nontrivial amount of time. Nobody promised that the space
after your declared BSS and before your initial stack pointer would be
clear, but it has always been that way and some programmers chose to
depend on it. This is called a "settled expectation" and we have to
live with it in the name of compatibility.

>and this would increase the surrounding magnetic field considerably.

There's no particular reason why a monitor should be subject to RFI and heaters don't make RFI, at least, not continuously. Yes, your monitor is sensitive to magnetic fields. Monitors are. The reason the mono monitors seem more sensitive that others is because of the 70Hz refresh rate: it beats at 10Hz with the 60Hz fluctuations in the magnetic fields from all manner of stuff, especially cheap, leaky transformers ("power rats", for e.g.). Monitors that are operating at 60Hz will not shake because the 60Hz is pretty well synchronized with the power line. The monitor "crawls" instead, which is less noticable if the difference in frequencies is small enough.

This is why TV's in North America operate at 60Hz and those in Europe at 50Hz. What I'd like to know is how many people can see flicker on colour TVs? I can even see the flicker at 70Hz sometimes but others say they can't. I can't use a colour monitor comfortably because of the flicker.

> included in the new version of TOS. Maybe I'll see one by Christmas
> 1990...
> Myron Drapal
> AT&T Denver
> att!druhi!med

Well, I just couldn't let that pass, now could I?
First, I was never shown a review copy of the subject article. If someone wants to call me "chief developer" without checking first, I can't really control that, now can I, Mr. Drapal? [My business card says very clearly "Manager, Product Development", and I would never use the term "chief developer" - those days are past, and with other companies].

As to abuse of 'malloc', we did find several programs which, having allocated memory via 'malloc', then went and accessed beyond it, or assumed successive 'malloc's would always return contiguous chunks of memory, and relied on it. Now I consider that to be lazy, bad, programming practice. I have written a LOT of code in the past, at the OS, utility and business application level. Some of the code is still in daily use, running realworld businesses, five or more years later. My programming experience taught me never to assume anything and to abide by common-sense rules of design. (Please don't flame - it's only my opinion, and I know there are a lot of people who don't share it)

I am certainly in no position to defend earlier releases of TOS. The Mega TOS has been shipping with ST's for many months, so the "2 years between releases" is not quite accurate. I have tried to be as honest as I can in postings to this net, while maintaining a degree of calm which is sadly lacking in many postings. I DO appreciate frustration which may have been caused in the past, because I, too, have been on the receiving end of buggy OS and tools. I might point out that Apple hasn't had very good press recently, but two wrongs don't make a right, and I'm certainly not intimating that just because Apple appears to have made mistakes then it's OK for Atari to do the same.

But I stand by my comment of having to remove certain improvements and bug fixes because "misbehaved" programs broke. There is an incredible amount

of software out there, and I would guess that the vast majority of it is used by people that wouldn't know one end of a source file from the other. That is why compatibility is so important - people have money invested in their software, and would like to take advantage of the improved performance and features of the new TOS but don't want to have to pay again to buy new versions of the software, even if they were to be made available.

Compatibility is always an issue, and at some point it becomes necessary to 'bite the bullet' and say "Sorry, this is where we make the break". We have decided, and rightly so, I believe, that the time to do it is not yet. It may make sense to do it on the 32-bit line, where there are bound to be some problems with some software. We will address that issue quite soon, but need to survey the more popular products, talk to the developers, and THEN decide how much compatibility is mandatory.

As for the parting shot about delivery of the new TOS, we have had it in Beta for a couple of months, and expect to make a release to Developers next week. Lead times to mask ROMs are quite long at present, so I don't expect the new ROMs to be in production until late this year. But certainly before Christmas 1990!

I hope this (lengthy) response clarifies the situation!

Roy J. Good
Product Development, Atari Corporation

Views expressed are my own. Atari may agree or disagree; they have the right.

4887. different parts of an ST binary.

Newsgroup: comp.sys.atari.st
Date: 1988-08-05 19:24:23 UTC
From: rfpfeifle@violet.waterloo.edu
Message-ID: <8136@watdragon.waterloo.edu>
Source record: 251387

I'm curious about the way binaries are stored prior to being loaded for
execution, and about what the loader does to the program being loaded.

I understand that a binary contains three sections--a text section,
a data section, and a bss section. The text section and the data section
I think are pretty clear; the text is the program, the data is, well, data.

But what is the bss section for? And what does the loader do to addresses
in all three sections?

Additionally, what is the exact format that these three sections are arranged
in.

Thanks,
Ron

4888. Looking for a Spreadsheet for Atari

I'm look for a Spreadsheet to run on my ST. It doesn't have to
be very fancy, but should have the following features.

- GEM interface that works (I hate arrow keys)
- scientific functions (sin/cos/ln/log/... etc)
- being able to read in ascii data from a file into
columns and/or rows
- being able to dump rows/columns to ascii file
- save/restore whole spreadsheet to file

I have looked at Vip Professional and didn't like it, because
it didn't have a GEM interface and it was a bit expensive.
Granted, it has a lot of features, but features don't do me any
good, if I don't like the user interface. I wanted to look at
Antic's A-Calc Prime, but the dealer's disk was bad.

Any help would be appreciated, I'll post a summary of what I find
out.

4889. Memory access speeds?

Newsgroup: comp.sys.atari.st
Date: 1988-08-05 22:34:18 UTC
From: hyc@math.lsa.umich.edu
Message-ID: <396@clio.math.lsa.umich.edu>
Source record: 251389

Howdy again,
time for a somewhat naive question on my part. I've had my eye on one of those 16MHz speedups for my ST for awhile, but I'm really not sure how well it'll perform. Considering the clock speed, that'd mean data has to be ready 125ns after a request. Using 100ns DRAMs, that means you have a mere 25ns for address decoding & such. Anyone know how fast the ST's decoding logic runs? Am I doomed to the abominable wait-state, or will 80ns RAMs suffice, or ...?

Where is a good inexpensive source for ST parts? A place that sells both the custom chips AND the HARD TO FIND off the shelf chips (like the WD1772 floppy controller and the MC68901 mfp chip).

I have a lightning damaged 1040, and need to replace some of the chips including the MFP, DMA, floppy controller, CPU, and possibly the GLUE.

I have some of these (from scrounging around in FORMER Atari repair centers), but I would like to get some spares of these also.

Anybody got an emergency power system (500 watts) they want to part with? :-)

> slightly different connection.)

Please, let's get the facts right here. The Proline joystick is made by
Atari, however it is designed exclusively for use on the 7800 ProSystem.
The extra joystick lines are used for a second trigger button and will
confuse the ST's keyboard controller.

4895. Borland Turbo C for ST

Newsgroup: comp.sys.atari.st
Date: 1988-08-06 06:54:56 UTC
From: to_stdnet@stag.UUCP
Message-ID: <550@stag.UUCP>
Source record: 251395

From: thelake!steve@stag.UUCP (Steve Yelvington)

The following is forwarded from Fidonet, for whatever
it may be worth:

From: Peter Glasmacher
To: * Msg #245, 03-Aug-88 03:00pm
Subject: Turbo-'C' News

I had a phone call this morning (03-Aug-88) with th Turbo-C project Leader at
Borland in Munich, Germany. He gave me the following infos:

Documentation: printed and ready to ship, in German.
Beta testing: Deadline 05-Aug-88
Bug fixing : Deadline 10-Aug-88
General availability: September 1988....

These dates might be shiftet by max. 2 Weeks if serious bugs are found
(they don't expect any)

Code produced by Turbo 'C' performs at a similar speed as code executed on an
9 Mhz AT (no wait states).

Turbo 'C' uses a fast and unusual Parameter passing technique:
As much parms as possible are passed in the 68000 Registers. Only
variable parm function calls (like printf) are forced to pass parms
on the stack.

The cdecl modifier forces each function declared with cdecl to pass
its parms on the stack.

Turbo 'C' comes with a complete AES/VDI/GEMDOS Library. Most of
the non Graphics functions of Turbo 'C' (80xx) are implemented.

Because of the different structure of the Graphics Interface of
the ST, it was impossible to port the MS-DOS Routines in a relativly
short time (we don't want them eh ??).

My Beta-exemplar ships anywhere on the Ocean, I hope to receive
it in the next days... (a little late but.....)
A Turbo 'C' -ST team is recently founded at Borland of Scotts Valley,CA.
Therefore, everybody is invited to cry for that thing to be released in the
states.

BTW, cause I don't trust statements of official corporate people, I called the
Editor of the German magazine c't, who is responsible for the ST and tried to
proove the above things.
They have the Compiler already for (preview) and its as fast as Borland says.

Peter (as soon I get the baby, I'll post a msg)

> or wolf@csclea.ncsu.edu

STX-Windows runs on the 1040 ST and the 520 ST. It however, requires a minimum
of 1 MB (for IDRIS, STX server and one xterm). We recommend at least 1.5 MB.
That would allow about two or three xterm sessions, and of-course xclock :-)
The current production version of STX-Windows is X10.4.

My version of VIP has a GEM interface! Actually, you can get it either
way, or both for a low combined price. The version you saw was for
migrants from MS-DOS machines.

I've been using VIP for a while, and while the screen updating for the
GEM version is a bit slow, it is very full-featured. It is 1-2-3
compatible, which I have found very convenient.

4898. Re: How often does a typical laser printer Jam?

Newsgroup: comp.sys.atari.st
Date: 1988-08-07 16:12:49 UTC
From: kurth@sco.COM
Message-ID: <1002@scolex>
Source record: 251398

I used to have problems with printers until a repairperson told me
once that the sensors will not-operate correctly if a little bit
of dust gets on them (ergo detect jams that aren't there).

In liu of a full cleaning (which should be done peridically) I
used to just blow into the mechanism and that cleared up the
problems. Some machines have dust sensors built in which
are designed to make you keep the machine clean.

From what little I know about the VIP, I believe it has a GEM interface.
There is also Masterplan as well and one of the magazines recently covered
Spreadsheets fairly completely, RESET I think it was.
I think Phasar has the GEM interface as well. Other spreadsheets I have
heard about are
Logistix
Swiftcalc
EZ Calc

The Switcalc and EZ Calc I believe has GEM interfacing as well. Can't
remember if Logistix has it as well, my recall thinks it doesn't. Mind you
I have only tried these out in stores and never used any of them in depth.

I tend to use the PD one Sheet, currently up to 1.6 I believe.
Hope these other names help you.

4900. RE: be wary of ....

Newsgroup: comp.sys.atari.st
Date: 1988-08-07 20:50:26 UTC
From: lharris@gpu.utcs.toronto.edu
Message-ID: <1988Aug7.165026.10755@gpu.utcs.toronto.edu>
Source record: 251400

A few days back a member of the net Mike Nemeth posted a very nasty
article about a distributor called MicroD - who are in the Toronto area.
I have dealt with them before and as such I showed them a copy of the
article Mr. Nemeth had posted. Here is their version of what happened.
(the reason for this is I don't think the net should be used to badmouth
others for personal gain/revenge/spite!!)
The story I was told was:
1) Mr. Nemeth went to U of T computer stores with his dead drive and
demanded it be fixed (it was out of warranty).
2) The manager of U of T computer stores (George) called up Ann at MicroD
to ask about the drive. U of T said he had no reciept and on their books
it hadn't been purchased from them.
3) MicroD told george they should take it back to the retailer who
sold the drive originally, or ship it to Supra himself.
4) Mr. Nemeth, having no luck at U of T, went to another store called
Electronic Playworld. The same thing happened.
5) Mr. Nemeth calls up MicroD himself demanding something be done about
his dead drive. The conversation in the original message is fairly accurate.
6) It turns out the drive was originally purchased from a store called SBL
in toronto. They buy their drives direct from Supra in the States, not
from a Canadian distributor.
7) No one knows why Mr. Nemeth didn't go to SBL in the first place.
8) MicroD DOES SUPPORT their RETAILERS very well. They are not in
business to support retail customers.
9) My only affiliation with MicroD is as a satisfied customer in the past.

From: imagen!atari!apratt@ucbvax.Berkeley.EDU (Allan Pratt)
[... clearing all of memory ...]
This takes a nontrivial amount of time. Nobody promised that the space after your declared BSS and before your initial stack pointer would be clear, but it has always been that way and some programmers chose to depend on it. This is called a "settled expectation" and we have to live with it in the name of compatibility.

I believe it's a bug that programmers rely on undocumented features like that. Perhaps you want to allow those old (buggy) programs to continue to run; I would too, in Atari's position, but please, don't penalize the rest of us for those vendors' bugs. I'd be completely pleased if you'd provide a switch to turn the behaviour off. Lacking that functionality, those of us who care about such things (maximizing performance) will continue to bludgeon the the supplied code over the head.

This was posted on a BBS in New York. It mentions some rumours from the August issue of ST-Log. Can anyone else confirm if any of these are true?

=>From : Bob Mulholland
=>Subject : New News?
=>
=>Well, I did read some rumours in ST-Log (August issue). A third party is
=>working on GEM 2.2, which is now be marketed in Germany. It comes with GEM
=>Write, GEM Paint and GEM Draw. Atari may have the PC emulator out by this
=>Fall. Atari will be shipping the Imagen Postscript software clone called
=>UltraScript for the laser printers. Oh yeah, the price on GEM 2.2 is
=>300dm, which is about $148.00. Please don't anyone send me any nasty mail
=>about where are these products or "oh sure, will see them at crack of doom
=>with the rest of the vaporware." Remember, someone asked what was
=>happening and I'm QUOTING ST-Log (I hold no responsibility whether or not
=>they come true).

Has anyone out there heard anything about any of these? I seem to recall hearing some time ago about the UltraScript. The other stuff is interesting but new. Hope someone can confirm or deny some of these.

Thanks.

Problems with program-server.

Hi Atarians,
I just got to know about Atari program servers two weeks ago.
Though I am new in that business I am quite familar with BITNET-ing
messages and computering in general. I seem to have a lot of trouble
with the servers and I don't know whether thats a general trouble or
just something I am doing wrong.
Almost half of the programs,listings,... that I got are extremly
erroneous. The crazy thing is, some files come along perfectly and
some don't. There seem to be at least two different errors.
First of all some of the text-files, like ARBACK.C or SPEAK.C
are not complete. That is the most stupid thing in the world, if
somebody transmitts program sources to a server, which just end
right in the middle of the program. They can be deARCED and UUDECODEd
correctly, so the transmission to my userid seems to be okay and it
must be the case that come crazy guys are putting incomplete stuff into
the servers archive.
The next error is that the files can be UUDECODEd but deARCing shows
a CRC error. This happens with GULAMDOC.ARC, MORE14.ARC, SPEAK.ARC,
HDSCAN13.ARC and with all (!!!) the files form the new server at SSYX.
To me that is not a problem of the IBM 4831 (where I am receiving the
files) but a problem of the files in the program servers archive, too.
I got send the files from the new server at SSYX but accident more than
20 times (in words: twenty !!!, though I just ordered them once) and I
checked a couple of the files. They are all identical, that means it is
not a problem of transmitting the files. It must be that the original
files are just not okay.
So my questions is: Why is somebody organizing a program-server with
wrong, erroneous and incomplete files ?
I have a bit of experience in the IBM-PC world (and a lot with ATARI-ST),
but I have never had such problems with any PC-program server.
There is another strange thing. The PC-servers that I know use just
binary file transfer, that means the transmit 8 bits and not 7. Their
files are not (!!!) UUENCODED. That has a tremendous advantage (or I
should say UUENCODing causes additional trouble, where you need a wizzard,
as some computer folks would say). Using UUENCODE means, using a certain
text-notation (ASCII). But the IBM uses EBCDIC-code and not ASCII-code.
The problems arrises because, there are no equivalent characters for the
square brackets in the EBCDIC-code. The IBM realizes the problem and
has a biult in UUDECODing feature, so that I can decode the files there and

then transfer them in a binary mode down to my ST. If I would transfer
the files directly with a 7-bit transfer (KERMIT in TEXT-mode) the files
would be damaged. The same thing is happening to program sources, if
they are not ARCed. Once they are in a TEXT-mode on the IBM I cannot get
the square brackets down to any other computer. They are lost.
Why in the hole world are the Atari-freaks doing things so extrem
dangerous (for the files) and complicated (for the users) ???

|
|
| YIPPEE!!

Don't hold your breath. After play-testing mine for a couple of hours, I'm ready to take it back. I'm sorry, but I got spoiled on the quality of FS-II (also from Sublogic), Gunship, and Carrier Command. JET! is a hoax, a sheep in wolves' clothing.

Main problem: the graphics are cool... too cool. There's just too much for the poor ole' CPU to keep redrawing. And, while it is busy taking the 0.8-1.2 seconds (!) to recompute the screen, you've zoomed about 660 feet and possibly done 180 degrees of a barrel roll. No way. Not anywhere's enough feedback. Heck, even the "auto-level" mode can't move the stick fast enough to hold you steady!! And, that's the computer making "perfect" calculations.

I repeat. The program is a joke. Darn. I'd really hoped for the next step up. Go get Harrier Attack if you wanna shoot down things with a jet. I'll stick with Gunship for shooting, and FS-II for flying. (And Carrier Command for complexity :-).

Hey you guys at atari, thanks for the responses lately.
I would like to congratulate you on your cool-headed responses
to some hot-headed flames. There are more anti-Atari flames
than I think are warranted in this news group. I don't know if I
represent a silent minority (or majority), but I though that
I would put in my two cents.

4909. Jet...Good/Bad News

Newsgroup: comp.sys.atari.st
Date: 1988-08-09 00:56:51 UTC
From: trb@stag.UUCP
Message-ID: <553@stag.UUCP>
Source record: 251309

This is just a summary of my first impressions of Jet by Sublogic (for the ST). I finally got a chance to play it a bit this last weekend. After doing a little practice using the computer as an opponent, I called up a friend who also had Jet and we spent about 4 hours playing head-on-head dogfight over the modem. Great game. Very smooth motion, and a very realistic feel to the combat (i.e. you swing by your opponent, pull a tight loop, get on his tail and start trying for a heat-seeking missle lock while taking some potshots with the machine guns, just as your opponent hits the airbrakes, disappears behind you, and seconds later your missile lockon alarm starts going off, so you dive and switch the radar off, hoping it was just a radar lock type missile as opposed to a heat-seeking one...) Very nicely done, right down to the parachute descent (in case you have to eject), which you can watch from the tower or spotter plane. Also, as in Flight Simulator, you can supposedly play against either the Atari version or the Amiga one over the modem.

So, what is wrong with it? We noticed two things. First, every once in a while, the keyboard control will just go away...so you crash and have to reboot. Luckily, this doesn't drop the modem line, or seem to affect the other player. This happened about once an hour or so, so was only a minor nuisance. A more serious problem only manifests itself if you have a MEGA-2 (and possibly a MEGA-4). The game appears to run 1/3 of the speed on the MEGA systems. I tried it without the Blitter activated, with no effect. I tried it on 4 different MEGA-2 systems (both color and mono) and got the same slow-down. It was NOT playable at that speed and could really give people a very poor impression of the MEGA (and JET) if they bought it and compared the program to JET on the IBM PC.

I called Sub-Logic about these two problems (they didn't act surprised), but it sounded like they hadn't had a chance to look into the problems much yet... i.e. they wrote down my description of the problem and said that they would call if they needed more info. I would guess that the slow-down problem is related to the MEGA-Rom's, in which case the new 1040 ST's will also have this same problem, since they come with the MEGA-Roms now (according to our local dealer). Has anyone at Atari checked with Sub-logic on this? Simple oversights like this can DRASTICALLY affect peoples decisions to not only buy the program, but also the system it runs on...I know of a lot of people that were convinced of buying the ST by simply seeing a demo of Star-Glider several years ago.

4910. MW_C Bugs

Newsgroup: comp.sys.atari.st
Date: 1988-08-09 01:33:00 UTC
From: FORTINP%BNR.CA@FORSYTHE.STANFORD.EDU
Message-ID: <8808090132.AA21415@ucbvax.berkeley.edu>
Source record: 251310

Well, I am finally getting around to learning/using C and 68000 asm...

However, I have run into the following problems which I think I can
safely say are not of my doing:

1) I tried assembling the DIALXR program in the July/88 ST-Log...
Oops, differrent assembler syntax... (search, thumb, search, flip)
Ah! MW_C has "as68toas" source conversion program. Great! Let's
let 'er rip...

Hmmmm...?
Input: loop tst.l (a0)+ ;is vector available?
Output: loop: tst.l (a0)+;is /vector available?

OK, let's try a test...

Input: loop tst.l -(a0) ;is vector available?
loop tst.l (a0)+ ;is vector available?
loop tst.l a0 ;is vector available?
loop tst.l (a0) ;is vector available?
etc.
Output: loop: tst.l -(a0) /is vector available?
loop: tst.l (a0)+;is /vector available? <===<<< ;-(
loop: tst.l a0 /is vector available?
loop: tst.l (a0) /is vector available?
etc.

2) Awright, manual fix to the above and we should be off and running...
Surprise! Now "as" wants a piece of me...

Input (any of): btst.b $1,status_flag /is bit set?
bset.b $1,status_flag /set bit
(and probably 'bclr.b' & 'bchg.b')
Output_msg: "o: undefined symbol"

Yet... this code made it unscathed through "as68toas"; while
a 'sub.l #' got converted to 'subi.l $'... nice touch here :-)

BUT... my 68000 manual says "Attributes: Size=(Byte,Long)"!...?

Pierre Fortin
FORTINP@BNR.BITNET (I think, I've never mailed myself...)
In Canada's capital: why do I usually have to locate it relative to

4911. MW_C Micro-shell (MSH)

Newsgroup: comp.sys.atari.st
Date: 1988-08-09 02:15:00 UTC
From: FORTINP%BNR.CA@FORSYTHE.STANFORD.EDU
Message-ID: <8808090215.AA22209@ucbvax.berkeley.edu>
Source record: 251311

Tip:

When I'm coding/compiling/debugging/correcting/etc., I hate typing more than I have to, just to edit my file, or remember to include the same options each time I compile. So... I thought some of you might like the following code which I added to my PROFILE file for MSH.PRG (it allows me to type just "e" to edit the last edited file, or "c" to re-compile the last compiled file (incl. all the options)). If someone has one which can survive a reset, or re-invocation of MSH, I'm interested.

```
set in .cmd lastedit='echo "Editor not previously invoked..."'
set in .cmd e=(
if (is_set in argv 1) (
set in .cmd lastedit="me $1"
me $1
) (
lastedit
)
)

set in .cmd lastcomp='echo "Compiler not previously invoked..."'
set in .cmd c=(
if (is_set in argv 1) (
set in .cmd lastcomp="cc $*"
cc $*
) (
lastcomp
)
)
```

Question:

Why is it that I can set multiple directories to search for in the environment variables PATH and LIBPATH, but INCLUDE does not allow this "feature"? ;-(

Pierre Fortin
FORTINP@BNR.BITNET (I think. I don't usually mail myself...)

4912. Question: MW_C 2nd PROFILE

Newsgroup: comp.sys.atari.st
Date: 1988-08-09 02:26:00 UTC
From: FORTINP%BNR.CA@FORSYTHE.STANFORD.EDU
Message-ID: <8808090226.AA22339@ucbvax.berkeley.edu>
Source record: 251312

In MW_C, I like the ability to tailor my environment via the PROFILE file; however, does anyone know of a way to automatically invoke a second profile for use when temporarily returning(?) to a second level of the MSH via the CTRL-C key when in the "me" editor?

In the first level shell as an example, my prompt might look something like "c:\mw_c\pf>" (great, because I always know my current working directory); while all I get in the second level MSH is a (slightly less meaningful than an MS-DOS "A>") "$" prompt.

> The Citadel network now stands at 52 nodes, including one run by Atari Corp.
> (408-745-xxxx).

If you call the number given in that post, you will be very disappointed.
The STadel board at Atari is for outgoing calls only, for purposes of
networking to other STadel boards. Please do not call it! We cannot tie
up that line. The board won't accept callers anyway... and no one is
supposed to even know the number.

Remember, the number for the real Atari BBS is (408) 745-5308. That gets
you to one of the 5 lines, currently using the Michtron BBS software.
STadel and FoReM are used for networking only, not for incoming calls.

This is inherited from the Unix Bourne shell - it's how you execute the commands in a shell script without starting up a subshell. (You could execute the script with something like "msh comfile" but if it's something like "profile" it doesn't do you much good...)

> chmod mode file [...]

From: Robert.Lisowski@rubbs1.FIDONET.ORG
Message-ID: <12.22FECCF9@rubbs1.FIDONET.ORG>
Source record: 251318

Flicker is most pronounced in the part of the retina that surrounds the
central area. The response is much slower for the point at which you are looking.
If you look at a 65-70 Hz light source, you may or may not notice
flicker, but if you look slightly to the side of it, you likely will
notice more pronounced flicker.

Also, the persistence of the phosphor in the display will tend to
smooth out flicker at the expense of image quality due to smearing.

All these factors go into designing the compromise that sits on your
desk. :-)

I'd like to get some plausible fantasizing going. Now that Megabyte has their accelerator out, how about Atari? Wouldn't it be nice if the next thing after the new ROM-s was true 16 MHz ST-s and MEGAs? Seems to me that by altering the custom chips a bit (not an overnight job, but not development from scratch either) the 16 MHz clock could be taken very good advantage of (assuming faster memory, too, but why not?) Or for a little more oomph out of the same design, a chip with a bit of an instruction cache (68010?). The AT of the ST world as it were: a bit faster, and some of the kinks ironed out, xDbut otherwise the same.

>
>> chmod mode file [...]

chmod - Change mode of a file, chmod [+-][shmw]
s - system file (hidden from normal directory searches)
h - Hidden file (" ")
m - backed-up
w - Write allowed
Preceding the above modes with a '+' adds the mode, a '-' removes it.

>> drvprs [-q] drive

Checks to see if a drive is present. -q supresses verbosity.
For use in MSH script conditionals.

>> inherit variable ...

Allows a sub-shell to inherit a variable set in its parent
shell.
>> lc (I use this instead of 'ls' in my PROFILE)

An alias for ls -w in msh.

>> mousehidden

Returns the number of times the mouse has been hidden. Under
"GEM" the mouse must be "restored" as many times as it was hidden
before it will reappear.

>> mshversion

prints the current version of msh.

BTW, I don't use msh. I much prefer Gulam. Gulam's aliasing facility
is, in my opinion, superior. Plus, it has an emacs editor built in, and
command line editing. Just my preference's.

> next step up. Go get Harrier Attack if you wanna shoot down things
> with a jet. I'll stick with Gunship for shooting, and FS-II for
> flying. (And Carrier Command for complexity :-).

It seems that the speed of JET is inversely proportional to the amount of memory one has on an ST. For instance, a friend and I tried JET on the various STs we have, and came up with the following:

520STfm, 512K: JET runs great, acceptably fast
1040STf, 1024K: a bit slow--playable, but most won't like it
1040STf, 2.5MB: much slower than 1 meg, unacceptable
Mega 4, 4MB: way too slow. For launching, one screen refresh when you start, another when you are in the air.
Very unacceptable.

We haven't tried running any reset-proof ramdisks or such to resize apparent memory. I'll report on this as soon as the attempt is made.

> August issue of ST-Log. Can anyone else confirm if any of these are true?
> [stuff deleted]
> =>A third party is working on GEM 2.2, which is now be marketed in Germany.
It is true that AMC in Germany has been working on a GDOS clone, with performance improvements. Atari US is also working on an enhanced version of GDOS, due for Beta later this year in conjunction with other products. The Atari version will include other major enhancements as well as addressing performance issues. It will also be thoroughly tested for compatibility.
> Atari may have the PC emulator out by this Fall.
PC-Ditto has, of course, been out for a long time. The emulator being referred to was contracted to a thrid party, who appears to have some difficulty in the final stages. This is not a project I have any direct involvement with.
Atari will be shipping the Imagen Postscript software clone called
> =>UltraScript for the laser printers.
This, with other associated software, is also due for Beta later this year.

AS WITH "TOS", WE WILL POST FULL DETAILS OF THE NEW PRODUCTS AS THEY APPROACH FINAL STAGES OF ALPHA TEST. PRODUCT FEATURES (AND SCHEDULES!) CHANGE AS A RESULT OF TESTING AND MARKET TIMING, WHICH IS THE PRIMARY REASON I DO NOT POST INFORMATION BEFORE I THINK IT IS DEFINITIVE.

Roy J. Good

1) Malloc has never worked properly, and by the sounds of the
Computer Shopper article and your own confessions, it really
won't work properly in the near future. Malloc, as defined
in the UNIX environment (or by K&R, Page 173, if you prefer),
will allow you to allocate or free memory in any machine-
compatible size in any order until you run out. Does the
TOS version do this? Will it ever? I realize that you might
take exception to this definition of Malloc, but Atari doesn't
seem to believe in manuals or written documentation of any kind
(plausible deniability).

2) I admit the examples that yourself and A. Pratt provided *do* show "misbehaved" code, but can you really be sure that this is not a side-effect of a permanently broken Malloc? Don't get me wrong here, I'm not defending the coding style, since clearly this code would fail in most UNIX environments. "Thou Shalt Not Screw With Memory Thou Ownest Not" (quote from A. Pratt) is a fine motto, if a simple corallary of it is "Malloc will allocate any free memory, and free will deallocate is in any order." Having a 1 or 2 meg system on which you can only malloc about 20 times, and must free in exactly the reverse order of allocation is a ***JOKE***.

3) Two wrongs don't make a right, but one good right will make up for a number of wrongs. Talk to Commodore or Apple users (I don't have one, but I know quite a few people who do). Timely updates provided to the OS, with disks *AND MANUALS* provided at a reasonable charge (media costs + small charge) will go a long way towards making your users and developers happy.

4) As far as I'm concerned, the "2+" year clock is still running on the next set of TOS ROMS. The ones provided in the MEGA series never really made it to the public, due to problems, some much worse than those it fixed. I'm not asking for a free upgrade: just a reasonably priced upgrade in a shorter amount of time. The fixes listed for this new version of ROMS is good, but it shouldn't have taken "2+" years for these fixes to become available.

5) I *DO* appreciate your situation regarding buggy OS and tools, but I do feel that if Atari wants to keep the ST alive with third party software (it may be too late for this already, re: good developers going elsewhere), they better get their act together and *SUPPORT THESE DEVELOPERS*. Without them, the ST will die a slow and painful death.

6) I've heard the "Any day now" story from Atari much too long now. I'll believe the TOS ROMS by "late this year" when I can go to my local dealer and buy them. Until then... Waiting for MINIX so I don't have to put up with the ol' GEM dog no more...

I know I'll probably get some hate mail from a few of you True Blue Atari owners out there who will claim that I'm just Atari bashing again. Well, it might be true, but I really hate to see such a wonderful machine go down the tubes due to the stupidity of a few at Atari Corp.

That would be a pretty stupid move. No one else in the UNIX world uses GEM for there machines. X11 would be the way to go. But, this is Atari we're talking about isn't it? :-)

>I think are pretty clear; the text is the program, the data is, well, data.

It can contain a symbol table and relocation information as well.

>But what is the bss section for? And what does the loader do to addresses
>in all three sections?
>
>Additionally, what is the exact format that these three sections are arranged
>in.
>
>
>Thanks,
>Ron

This is what I could come up with; if Allan Pratt is reading this he can both take note of the bugs in Pexec (if they are not already fixed) and correct me if I'm wrong:

Note that I'm mostly talking about the binary, i.e. the program file, not the in-core process image (unless stated otherwise). By loader I mean that part (subroutine) of the Pexec code that actually loads / relocates / clears the image from the program file. This is what I could make of it after consulting the ROM (rumors only manual 8-); any comments / corrections happily accepted:

The binary starts off with a header of 0x1c bytes. First I will give a short explanation of each item in the header, then some details.
The first two bytes (0x0-0x1) must be 0x601a.
The bytes 0x2-0x5 give the text (=code) length. The text starts immediately after the header, at address 0x1c. It contains all executable statements in a relocatable format.
The bytes 0x6-0x9 give the data length. The data segment starts immediately after the text segment. In this segment all initialized static and global data is stored (relocatable).
The bytes 0xa-0xd give the bss length. The bss segment contains all uninitialized data and as such DOES NOT OCCUPY ANY SPACE in the binary.
The bytes 0xe-0x11 give the symbol table length. For most programs this will be zero; the GST linker creates a symbol table if you link with the -debug option. This table is typically used by debuggers, not by the

loader (skipped).
The bytes 0x12-0x19 are currently not used, as far as I can see (reserved for future use?).
The bytes 0x1a-0x1b constitute a flag; if it is non-zero, no relocation is done.

Details:
If the first two bytes are not 0x601a, the Pexec fails with an error code of -66. There is a problem with this failure because the file opened by the loader is not closed. This can run a program (e.g. a shell) out of file descriptors. A workaround for this bug is to first open the program as a file and then close it (giving you the 'next' file descriptor); when the immediately following Pexec fails with error -66 Fclose should be called with this descriptor. In some other cases as well Pexec erroneously does not close the program file after an error in the load function. Probably the safest for shell programs, makes etc. is to explicitly close the program file when Pexec returns an error (and also after running a file that had the relocation flag set, see below).
The loader puts the starts and lengths of text, data and bss on the basepage. The text segment starts 0x100 bytes after the start of the basepage. If we consider the basepage as consisting of an array of longs (for simplicity's sake):
the 0th is the start address of the basepage
the 1th is the end of the program ('one past')
the 2th is the start address of text
the 3th is the length of text
the 4th is the start address of data
the 5th is the length of data
the 6th is the start address of bss
the 7th is the length of bss.
The loader copies the text and data segments into the process image from the program file.
The loader fills the bss with zeroes in the image, and in fact all space occupied by the program except for the text and data segments; this has been a topic for discussion in this newsgroup which I will not go into now.
If text size + data size + bss size > the allocation for the program the load aborts with error -39 (out of memory?). Also in this case the program file remains open (bug).
If the flag at 0x1a-0x1b of the program file IS 0, relocation is done as follows: the long just after the symbol table is interpreted as an offset from the text start pointer to start relocation with; if it is < 0 or > text length + data length the loader aborts with error -66. The rest of the bytes (after the long) are relocation information, were 0 indicates 'done' and 1 indicates 'skip 0xfe bytes'; every other value means: add this value to the current relocation pointer and relocate the long at that new address by adding the start of text to the value already at that address (an ST binary is relocated relative to the start of text). So generally speaking 1 byte suffices to point out a value to

be relocated.
The null filling is done after the image has been relocated; if the
no-relocation flag is set (0x1a-0x1b), null filling is NOT DONE!
(how's that for settled expectations, Allan? 8-).
Isn't that nice to hear for all those performance freaks??! Note
that this means that also the bss is not cleared (incorrect, at least for
C programs), and again in this case the program file is not closed.
About the symbol table: the following declarations should explain the
layout; the table is in fact a 'naminfo array':

```
#define UNDEF 0x2000
#define ABSOL 0xA000
#define GLOBAL 0xA200

typedef struct naminfo {
char d_name[8]; /* name of symbol */
short d_type; /* type of symbol: see above for values */
long d_address; /* address (relative to start of text) */
} naminfo;
```

About the layout of the header of the program file and the basepage
of the image: of course you should use a neat struct that clarifies the
layout of the stuff (some compilers have it already in header files); I
didn't care to do so in this particular case.

Besides loading the program file Pexec does some other stuff as well,
before it actually switches to the new process. If you're interested
I could tell you in a follow-up (this one being long enough already).

This was about what you were looking for? Enjoy.

Leo.

4933. Re: Clearing memory [was Re: Another great quote from Mr. Good]

Source record: 251333

This memory clearing stuff reminds me of an intresting discovery I made a
while ago, I had a small (very small) program that I wrote to test out the
assempro assembler that I had just bought, all the program did was switch
resolutions from med to low and low to med. The odd thing was, that when
I assembled it with the pc relative option on, there was no pause before
the program ran like there was when I ran the non pc-relative version.
I thought that this meant that the relocator was extremly slow, however I
have since been informed that the relocator is in actuality quite fast, and
that a possible explanation is that pc relative programs do not have memory
cleared before they are executed. Anybody got the real story???

This is not an inexpensive solution, as you need a slot and you will need
to do some driver work for this board. You may want to talk to Micropolis
about getting a recommendation on what they use to do similar work.

Hmm, that's odd. I've tested ALL of the STadel 3.xx release
versions on all* versions of the roms (including test versions of TOS 1.4)
and I have never had any problems that were related to the ROM version
or the computer (520, 1040, mega).

From: actor@percival.UUCP
Message-ID: <1312@percival.UUCP>
Source record: 251337

If you're looking for an ST spreadsheet that uses the GEM interface, with some Lotus compatibility, for a reasonable price, check out Analyze. It's .WKS-file compatible, has MUCH better graphics than VIP, and retails for $34.95. Beware, though; it used to sell for $100 before it was picked up by its current distributors (my employers, as a matter of fact) and some stores are still trying to sell it for this price.

I don't think the hardware should be to hard. You need just about the same set up all of us are using. An Atari to SCSI adapter and a SCSI to ESDI adapter (rather than the SCSI t506 adapter normally used). These are available from Adaptec. If the software interface is compatible with the other Adaptec controller you should be all set. Otherwise ....
Good luck.

I don't think it's stupid at all. It means you could run a large number of ST programs. That would be a big plus in my opinion! Assuming you could make it coexist with UNIX and still run without recompilation.

Also, regarding my request for blitter information posted earlier (from a different site), I made a reference to the number an article had in comp.arch on our system. Obviously (now that I think about it) the number may (and probably will) be different at your site.

Thanks!

4943. fading SM124 fix

Newsgroup: comp.sys.atari.st
Date: 1988-08-10 13:31:26 UTC
From: XBR3D815@DDATHD21.BITNET
Message-ID: <8808101333.AA23692@ucbvax.berkeley.edu>
Source record: 251343

[line eaters breakfast]

Some days ago i sent a plea for help to all Atarians in netland:

> Is someone out there in netland who knows a difference between older and the
> newest SM124 B&W-monitors which could explain the following behavier:
> Mega ST4 and old (Oct. 87) Monitor:
> In reverse mode (light text on black background) is brightness dependent
> on information on screen !
> Mega ST4 and new (Mar. 88) Monitor:
> The symptom does not occur !

Our dealer didn't know of this problem, he told me all SM124 monitors are returned to Atari for repair because they get no parts from Atari. So they have no experience with these monitors. (Thanks to V.A.Brandt who gave me an important hint)

I decided to take an oscilloscope and did some measurements.
As far as i know at two places the brightness of a CRT is controlled:

1) the first gate (hope this is the right technical term)
2) the cathode voltage/current.

The voltage between cathode and 1st gate should be constant, by adjusting this you can control brightness of the monitor.

Therefore i measured the voltage of the first gate against ground: it was constant, so this was apparently not the cause of the trouble.
Then i measured the cathode voltage, which should be +70V as the schematics say.
I found these voltage to be screen-image dependant:
with a light screen i found +70V,
with completely dark screen i found +85V.
The cathode current varied between 0mA (no bright, no contrast) and 17mA (full bright and full contrast). So i think the problem is a bad regulation of cathode voltage. If the load is too small (dark screen or only some light characters on a dark screen, the cathode current is small) cathode voltage goes up and voltage difference between cathode and 2nd gate goes down ---> screen fades.

And now my fix:
Beware --- I'm a simple minded chemist who ownes a soldering iron but is not an EE, so i will take no warranty for any side effects of my fix. It works with our monitor, but i fixed it today and so have no experience on the long run.
It's a simple fix and should do no harm to your SM124. What do i do?
I put a little extra load (1.5mA) at the high voltage transformer, so that the current never sinks under 1.5mA and cathode voltage never goes up again. With maximum brightness and contrast i measured 17mA, in normal operating condition

about 8-13mA, so this extra current should never overload the transformer. But i give no warranty for this! Be carefull if you turn on full brightness and full contrast.

The procedure is given for a monitor manufactured in oct '87, the newer ones have a different PCB layout.

1. Open the monitor by removing the 5 screws.

2. Look at the small board which is plugged on the end of the CRT. There you find the names of the parts printed. Look for C308 (47uF/100V) at the lower right edge of the board. If the board is covered with a shielding, you may have a newer monitor and this fix possibly does not apply.

3. Get a resistor 47k ohms 0.25 W and solder it across the pins of C308.
Put the resistor at the right boarder of the board so that it does not touch the monitor box later.
Pay attention to the small space between the monitor box and the board.
Possible Damage of your monitor!

4. Close the monitor, cross fingers and switch on. Problem should have gone.

PP: I also found some differences between the circuit drawings and the actual board, but this should be no problem. But i supplied R302 with 1k/0.25W, but this is not necessary for the fix

part was should be

R302 open 1k
R311 68R 47R
R312 270R 240R
R313 820R 680R

I hope this will help someone else, forgive the rather long posting.

I tried to send this by e-mail, but it was returned -- sorry.

In article <168@cstw01.UUCP> Frans Meulenbroeks writes:
>I have laid my hands on an ESDI disk, which I would like to interface to
>an atari ST. However, being out-of-hardware for several years now, I'm
>having some questions:
>
>1) What exactly is ESDI? Where can I find the spec, who can recommend a
> book or an article on this subject?

ESDI stands for Enhanced Small Device Interface. It is a draft proposed
American National Standard. If it is approved, it will become an ANSI
standard. You can buy a copy from Global Engineering Documents for $30.00.
They know it as X3.170-198X and are at 800-854-7179 or 714-261-1455. There
is also an electronic copy of the WordStar files for this document on the
SCSI Bulletin Board at 316-636-8700 (I'm the Sysop).

>2) How does ESDI relate to ST506/ST412? and to SCSI ??
ESDI uses similar connectors to ST506, but it is a different protocol --
the data separator is in the drive, instead of the controller. SCSI is
an intelligent interface (controller to system) instead of a device level
interface like ST506 and ESDI (drive to controller). Embedded SCSI drives
include the controller in the drive.

>3) I know how to interface a disk with a ST506/ST412 or SCSI interface to
> the ST. Is it doable to convert ESDI to either of these?
> (Big wish:) Anyone by any chance aware of affordable boards to do
> this? Magazine articles ??

Yes, you can easily go from SCSI to ESDI. Several manufacturers make such
controllers, including NCR (800-325-SCSI).

In Article 9839 of comp.sys.atari.st, lharris@utgpu.UUCP does a wonderful job of getting the story from one side, that of MicroD's. I'd now like to rebut and clarify some of those "facts". Since Mr Harris couldn't take the time to mail me a reply as opposed to telling all of netland the "truth", it's only fair I get my chance to stand on the soapbox.

1) out of warranty? Let's see, I bought it on the 25 of April, and it died on July 30... yup, you're right, by a whole week. My mistake. Gee, I guess that means that I can't get my drive fixed north of the border eh? That's the impression I got from MicroD. Fortunately, that isn't the truth. George from the UofT was kind enough to point me at some people who repair drives locally.

2) no receipt? wrong again. sitting right in front of me this minute. who told you i didn't have one? another "fact" from MicroD?

3) I don't know anything about this. The UofT computer store has been less then forthcoming about information concerning said drive. No documentation, missing software on stiffy, and no help when it came to getting either.

4) The folks at Electronic Playworld couldn't help me. They don't carry Supra drives anymore and all they did was point me to MicroD as somebody who might be able to fix the drive. Your timeline is also wrong. I called Electronic Playworld before I called the UofT.

5) Demanding? "Hello, I'm the owner of a dead Supra drive and I'd like to find out about getting it fixed" is demanding? I wish I could've taped her response. I'd use it to scare away seagulls.

6) I'd like to thank you for that nugget of information. It's the first I'd heard of it. See 3) above. Why couldn't the UofT tell me that?

7) See 6) above.

8) No comment. I'm not a retailer.

9) My supplier right or wrong eh?

If MicroD wants you to "explain" anything else, post it to alt.flame.

>1) What exactly is ESDI? ...
>2) How does ESDI relate to ST506/ST412? and to SCSI ??

ESDI is sort-of-kind-of an improved ST506/412. It was designed to be a
better and faster drive-to-controller interface. Its relationship to
ST506/412 is as a (superior) competitor. It is unrelated to SCSI, which
is a controller-to-host interface.

>3) I know how to interface a disk with a ST506/ST412 or SCSI interface to
> the ST. Is it doable to convert ESDI to either of these?

Much the same techniques used for 506/412 interfacing should be applicable,
I would guess -- I'm not up on the details -- but converting ESDI to 506/412
is probably not practical; they differ too much in details.

Converting ESDI to SCSI basically means buying a disk controller that talks
ESDI to disks and SCSI to the host; finding such on the commercial market
shouldn't be hard, since SCSI is common nowadays and ESDI is increasingly
widespread too.

NOW HOLD ON THERE, LET'S NOT BE HASTY!

You certainly CAN use the 7800 Proline Joystick with the ATARI line of
computers, all you've got to do is be careful when you use it:

Never boot your system with the Joystick in the socket.
Never reboot your system with the Joystick in the socket.

Why?
The IKBD is sensitive to highly resistive joysticks,
DURING POWER UP and RESET.

MANY joysticks have this problem.

So don't leave the Proline plugged in when you boot.

According to user's comments on GEnie, Jet slows down if more than 1/2 meg
of memory is present. Most noticable on the Megas, it supposedly also occurs
on the 1040. Work-around is to run "make512.tos" or an appropriate sized RAM
disk before starting Jet. I have noticed a slight slowdown (could be my
imagination) when I _don't_ use a 1/2 meg RAM disk on my 1040; the affect is
supposed to be much more pronounced with the Megas.

[some lines deleted]...
>I thought that this meant that the relocator was extremly slow, however I
>have since been informed that the relocator is in actuality quite fast, and
>that a possible explanation is that pc relative programs do not have memory
>cleared before they are executed. Anybody got the real story???

You hit the nail on the head. The real story is, that when the word at
0x1a of the binary is non-zero, no relocation is done; the memory clearing
is also not done (which is incorrect as far as the bss part is conceirned,
read your K&R), which you may consider a bug or a feature, and the program
file (which was opened to be read into memory) is not closed (a bug).
I posted an article some days ago about the format of ST binaries; you can
find more info there.

Your assembler obviously set the word at 0x1a when assembling
'pc-relative'. I find the expression 'pc-relative' a bit strange in
this context; pc-relative is an addressing mode on the 68000 which can
be used only for reading. If you want to write to a location in this
way you have to load it into an address register first (or something
similar). Example:

```
lea.l flag(pc),a2
st (a2)

flag dc.b 0
```

Perhaps is meant: address register indirect with displacement. Example:

```
* a2 already loaded with start of a data area
st flag(a2)

flag equ datarea+20
```

This is also used by many of the C-compilers; at the start of a program
an address register is loaded with the start of a data segment (data or
bss), or preferably 32K further. This addressing mode can address 64K;
if the segment is larger, absolute addressing is used generally (AND
relocation!).
The exact story of how registers are initialized by Pexec I'll tell in
a follow-up.

Leo.

4958. Virus Notice

Newsgroup: comp.sys.atari.st
Date: 1988-08-12 00:18:00 UTC
From: BHOLMES@WAYNEST1.BITNET
Message-ID: <8808120304.AA01925@ucbvax.berkeley.edu>
Source record: 251258

I thought that this message would be good info for all ST users.
This is a message that has appeared on several BBS's here in
Southeastern Michigan.

Virus Warning!!!!!!

This is a warning being sent out to ALL ATARI ST users...there is a desk
accesory called DIGI.ACC that has been uplaoded to MANY Michigan BBS's.

The Sysop of the Digital Delay(313-546-4410) was going back through his file
section trying out old files, he tried DIGI.ACC, its a digital clock that
was uploaded by a new Atari ST user(i have not seen him before, and i am
knowledgeable of the few ST users out there, although i can always be
wrong), the acc when activated, opens a small window(2X5 cm) with a clock
in it, and the name Uhri at the top (The "U" has a double dot above it),
sometime during its running, it destroys the disk, apparently attacking
the FAT, the sysop (Kieth Troesch) was running it, went to drive A and
found nothing on it, with a disk editor (Michtron Utilities) he found
nothing in the boot track, i was curious, D/L'ed it, and ran it left it
to sit, after a while, with not mcuh happening, we continued chatting
on the BBS, when i logged off, i checked the disk to find nothing
wrong, i then called another BBS to put a message up about a "possible"
virus, i then again checked my disk, a terminal disk that i was testing
it on (i backed it up first), it contained the following files:

Vanterm<foler> Vanterm.cfg
Vanterm.prg
D_edit<Folder> D_edit.TOS
Maxidisk<Folder> Maxidisk.prg
Macromse.acc
trasnfer.acc
digi.acc
STtrubo.acc

When i did a Directory, i got Data on disk drive A not responnding, i checked
twice, trying dir's from diffent programs, and the desktop, with no
luck of finding anthing at all, i checked it with DLII by Simon Poole
and the FAT table was Bad.

Since i was on-line for so long, i do not know how long it took for it to go
off (the virus), but it definetly did go off.

So beware of DIGI.ACC, if you see it on a BBS, inform the SysOp of the
situation, or if you have, take great caution in its use, or delete it
all together.

If you have any questions about this, i can be reached on the following BBS's:

Digital Delay(313-546-4410)
Bloom County(313-582-0888)
The Island(313-675-5888)
Cosmic STomper(547-0440, semi private system, must have password active)
Downriver Outpost(675-4660)

Sorry, no Bitnet, Bix, or Compuserve address...

-Eric Connelly, Co-Sysop of the Digital Delay, Atari sysop of the Island,
Atari Co-sysop at Bloom County.

4961. Re: Another great quote from Mr. Good

Newsgroup: comp.sys.atari.st
Date: 1988-08-12 05:43:03 UTC
From: hyc@math.lsa.umich.edu
Message-ID: <399@clio.math.lsa.umich.edu>
Source record: 251262

I dunno 'bout you, but personally, I feel pretty disappointed that an improvement wasn't made, to accomodate the bad programming practices of other developers. I don't want to knock the software houses writing software for the ST's, but really now - these are supposed to be professional programmers, right? They're supposed to know what they're doing, and when they later discover a problem with previously written code, don't they have a responsibility to fix it themselves?

Developers have been clamoring for these bug fixes for an intolerable length of time. Wouldn't it have been "better" (sorry for such an insubstantial, abstract term here, but these are really my feelings more than deeply reasoned thoughts coming out here...) to have fixed the problem and convinced the folk with ill-behaved code to fix it, and release updates of their own? Certainly these developers don't expect to simply write a program, test it a bit, release it, and never be bothered by it ever again, do they? Bitrot is something we all have to deal with, releasing updates to existing software shouldn't be considered an especial hardship. It's a common sense expectation, like a fact of life.

I think this is making a Very Bad statement about Atari. It's telling the world that they're willing to be less than the best. Not only that, it's telling people who buy Atari products that they also must settle for less than the best, or else they should go find some other product to worry about. This displays the same attitude I dislike so much in Sun. ("You can't afford a Sun-4/260? No problem, here's a Sun-4/110, cheaper 'cause it's made with low-spec parts, slower parts, etc. Sun - because you don't always need the best."

Perhaps I shouldn't be so surprised at this. I dunno for sure. When I first laid my eyes on the ST, I goggled. "Wow, what a slick machine!" I know I'm not the first to have been fanatically devoted to Atari, and may not even be the last. The ST was just another amazing work of computing machinery from a a company I practically worshipped. Why else would people always be starting "my computer is better than yours" wars - we honestly believed that, yes, this computer *is* the best. But that attitude is long gone now. Yes, I feel somewhat disillusioned. Ah well.

I'm not gonna trash all my work on this now, though. It's still a decent machine, fun to work on, does neat things that no other micro does. But dang, it's lost the gleam. That spark of ingenuity, that air of superiority, that excitement is all gone. It's just another box on the market. hohum.

[If you couldn't tell by now, these are Very Definitely my Very Personal Opinions. Take 'em any way you see fit, while keeping that in mind...]

[lot of talk about unremovable directories, possible association with msh...]
I had this happen on my hard drive once, though I know it wasn't caused by msh.
While I do use msh, I found the culprit to be a corrupt copy of DCOPY 1.91.
Hard to believe that a bad download (I presume that was the cause) would leave
me with a still executable file, but execute it did, and when I tried to use
it to extract from an archive, I got some interesting screen wipes, but no
extraction. Wondering what the deal was, I played around some more, thinking
possibly I was doing something wrong. i somehow managed to issue a "create
folder" command, and couldn't escape from it. Finally I just hit a space and
then return. it created a directory named space on my hard drive. This
directory was very amusing in it's properties - it wasn't empty - I could not
remove it. It had only a single entry within it - a directory named space.
Not even a "." or ".." were in it. I could open that folder forever from the
desktop, if it would've let me. But it didn't matter, 'cause after opening it
once, you could never close it and cause yourself to drop back to the root
level.

The fix was to back up my entire partition, and then play with some sector
editors. Also pulled out my (blech!) MSDOS Tech Ref manual, (to look up the
FAT format & such.) and after a few minutes of sector editing I got the
directory back in working order. It was a rude experience, to be sure...
Ah well, that's what you get for playing in a strange, unstable environment,
I guess. (Moral - *never* *never* try to perform operations that involve
writing to a disk when you suspect the integrity of your currently running
program, or your system memory...)

>from the desk top, I get an error message something like
>"an item with this name already exists or it is write protected"... The
>msh command rmdir doesn't work either.

I don't remember that particular error message, but I've occasionally not
been able to remove an empty folder with msh; usually if I cd to inside the
directory and type rm * (even though it generates an error message), the
rmdir command will then work on the directory.

>Another unremovable folder is even more amusing. If you go inside the folder
>(from the desk top), there is a directory inside the folder, but this
>folder doesn't have a name. When you enter this directory, there's another
>no-name directory, ad infinitum!

I don't know about the infinite folder problem; sounds pretty bizarre to
me. Are you sure your disk is ok? Does it look the same after you reboot
or coldboot?

> right in the middle of the program. They can be deARCED and UUDECODEd
> correctly, so the transmission to my userid seems to be okay and it
> must be the case that come crazy guys are putting incomplete stuff into
> the servers archive.

A mistake often made in receiving files is to use the commands PEEK and
FILE instead of RECEIVE. But by default, PEEK only shows the first 200
lines of a file. You might enter EXEC DEFAULTS SET PEEK FOR * to avoid
this problem. Files that are truncated this way can be uudecoded without
any error message, but dearcing the result should result in a crc error.
By the way, I hope you use Dumas' UUD and UUE. If not, don't wonder
about difficulties ;-)

> The next error is that the files can be UUDECODEd but deARCing shows
> a CRC error. This happens with GULAMDOC.ARC, MORE14.ARC, SPEAK.ARC,
> HDSCAN13.ARC and with all (!!!) the files form the new server at SSYX.

That is what I've just written.

> files are just not okay.

Now I think there is a corrumping mailer. I don't think servers behave
like this. I don't know the server at SSYX, but I have no problem at all
in receiving files from the lakesys server (I use the path:
lakesys!netlib@csd1.milw.wisc.edu from earn) and from UH-INFO at UHUPVM1
(atarinet))

> So my questions is: Why is somebody organizing a program-server with

Expect perfection and you will always be dissapointed.
>

The above article reminds me of a story about IBM and Intel.
IBM released MS-Dos and used a few (software) interrupts that were
clearly documented as being reserved in the original 8086 doc.

Along comes the 286 that uses those interrupts for internal purposes
and breaks MS-Dos. Six months later a new rev of the 286 (the one that
finally made it to market by the way) comes along that does not use those
interrupts and Dos can run unchanged. IBM PC sales accounted for more than
50% of Intel's CPU chip sales at the time.

I for one agree with the argument that releasing a new OS that breaks
old software is a bad idea. Theological arguments about the proper
behavior of programs always take a back seat to compatibility concerns.

I work in the software business for a successful company, and we have
historically always supported old programs no matter how much it hurts.
Compatibility is a key issue for many computer products.

Remember the original PC clone wars? I worked for a hardware company then
that made a PC clone which they thought was "better" than the PC. It didn't
sell at all because it wasn't exactly compatible, you had to buy a special
version of DOS for it and "Ill-behaved" programs didn't run. Ill-behaved
programs are the rule rather than the exception, most programs that perform
really well were Ill-Behaved. Lotus-1-2-3 is a good example. Flight
Simulator is another (no longer considered a good performer, but it was
revolutionary at the time).

The lessons of compatibility are hard ones for engineers to learn because
they are often more concerened with "cleanliness of code" or "proper behavior".

While compatibility is not a universal truth, compatibility between OS
releases is a good thing. Would you be willing to wait six months for

new releases of all of your software so that it would run again?
No small business would, the hacker might. Small businesses and
non-computer-literate people are where the small computer market is.

I therefore think that Atari is doing the right thing here, a little
late perhaps, but the philosophy is right.

4968. Re: malloc bugs (s.b. Malloc bugs)

Newsgroup: comp.sys.atari.st
Date: 1988-08-12 20:12:01 UTC
From: braner@batcomputer.tn.cornell.edu
Message-ID: <5919@batcomputer.tn.cornell.edu>
Source record: 251268

[]

Use malloc() (lowercase m), the library function that came with your C
compiler. Assuming you got a decent compiler (Laser, Megamax, MWC, etc)
(I don't know about Alcyon) that will keep you out of trouble.
Make sure you use free() for what was malloc()ed, not Free().

The only case where you need Malloc() (uppercase M, the GEMDOG function)
is when you absolutely need to allocate more than 64K at once, since
malloc() takes an unsigned int as its argument, and an int on the 68000
is (or should be) 16 bits. (Some compilers, like Lattice, use 32 bit
ints on the 68000, with a major execution speed penalty.) The Malloc()
GEMDOG function takes a long argument. Usually you can allocate large
things in smaller pieces (e.g. a large matrix row by row, initializing
a vector of pointers to rows as you go, and later accessing the matrix
elements by double indirection -- which is faster than 2-d matrix
access anyway!). Use Free(), not free(), for freeing up what was Malloc()ed.

Actually Malloc() is not completely broken: you can use it a few times.
Just don't call it more than a few (say 20) times in a row, and try not
to call Free(). If you have to call Free(), then make sure you
are Free()-ing things in reverse order of Malloc()-ing them.
Malloc() was designed for the OS to allocate memory to programs
that are loaded, possibly in a chain of Pexec()s. It was never
designed for allocating a zillion little bits and pieces and freeing
them in arbitrary order. It is too SLOW for those kind of applications
anyway. That's where you need the _library_ function malloc().
It Malloc()s large chunks for you and manages the little pieces
locally.

**FLAME ON
Needless to say this probably doesn't belong here in this group but I did
take offense to the above comment. Howard states that the Sun 4/110 is less
expensive because we (Sun) use lower grade parts in it. Frankly he is full
of shit. He apparently doesn't consider the differences in such things as
power supplys, 12 slot versus 3 slot VME cages, completely different CPU
boards with completely different cache architectures, and slightly slower
clock rate which doesn't require the fastest parts available, not that they
aren't prime top of the line parts, but they don't have to wiggle their bits
quite so fast and are thus easier to make. (And some believe more reliable).

4970. Bug in VDI XOR mode?

Newsgroup: comp.sys.atari.st
Date: 1988-08-12 22:46:00 UTC
From: BROOKS@CSSS-A.Prime.COM
Message-ID: <-1154167295@CSSS-A.Prime.COM>
Source record: 251270

Hi -- I have a VDI programming problem, but first things first. We at Prime just got our outbound news allegedly turned on (I know, I can already hear you groaning) and I'd like to know if this reaches the outside world.

So please send me mail at the address below, with or without the answer, and I'll guarantee to reply to anything that I receive on or before Friday 8/19.

Another meta-question: does Atari run a service for non-registered developers to call with programming questions?

I'm trying to mark a spot on the screen with a colored cross, then erase it again -- in other words, a XOR operation.

v_pmarker with writing mode set to XOR produces an XOR-ed black cross (with writing mode REPLACE, we get the right color, but of course I can't erase it).

vrt_cpyfm, REPLACE mode, also does a XOR-ed cross. XOR mode does nothing.

vro_cpyfm does the trick.

Have I found known bugs (probably related) in v_pmarker and vrt_cpyfm? I checked the bindings; they look OK (Mark Johnson C, with the vrt_cpyfm binding corrected). ROMs are 11/20; GEM lessons from Tim Oren.

Mail replies please; I'll post anything interesting.

Message-ID: <35@volition.dec.com>
Source record: 251271
Cross-posted to: comp.periphs,comp.sys.atari.st

henry@utzoo.uucp (Henry Spencer) writes:
ESDI is sort-of-kind-of an improved ST506/412. It was designed to be a
better and faster drive-to-controller interface. Its relationship to
ST506/412 is as a (superior) competitor. It is unrelated to SCSI, which
is a controller-to-host interface.

This is a visual and semantic problem that causes a great deal of confusion.

In ST506 and ESDI, there is a board on the system IO bus (or some chips and a port on the motherboard) to which one attaches a cable; the other end of this cable is attached to a disk drive.

In SCSI, there is STILL a board on the system IO bus (or some chips and a port on the motherboard) to which one attaches a cable; the other end of this cable is attached to a disk drive, which has an on-drive disk controller.

It's just that in ST506 and ESDI,
we call the board-on-the-bus or chips-on-the-motherboard a
"controller" and the cable running to the drive(s) is called a
"drive-to-controller interface",
while in SCSI,
we call the board-on-the-bus or chips-on-the-motherboard a
"SCSI interface" and the cable running to the on-drive disk
controller is called a "controller-to-host interface".

To most people, there's still just a board in the machine and a cable going to a disk drive. The fact that the board is called an "interface" in SCSI because the controller is in the drive doesn't change the common terminology of calling the board in the CPU cabinet a "controller".

It is more accurate to call it an "interface", of course, because the controller (the thing that deals with the MFM or whatever modulation the drive uses) is in fact elsewhere.

It all hangs on calling the board a "controller" when in SCSI, it's an "interface". I can't repeat that too many times -- us board-swappers that don't learn the details of things are easily confused by details like this one.

(I don't mean that _you_ are confused, Henry -- it's just that your answer didn't really ease the confusion that had prompted the question.)

i'm sorry, i just can't tolerate this discussion anymore...

by not fixing some very nasty bugs in something as basic as memory allocation, you don't get a choice. no one is forcing you to get the new ROMs. you can always keep the old ones and never upgrade. it's just plain stupid to take the stance that we should maintain backwards compatibility for the sake of programmers that tried to fix the the deficiencies themselves. if that were the case, we all would still be using 8-bit systems with 4k memory and no new systems/software would ever be produced. i'd rather have a choice. now you have no choice. how many of the 500,000+ STs do you think will ever see the new ROMs anyway?

if atari really wants to please everyone, then offer 2 ROMs: one with and one without :^)

the ST is a very nice system (eventhough they recently raised the prices to developers). i don't think even the bitterest of developer out there could deny that. atari corp itself needs a slap upside the head every once in awhile, though...

(this is not directed to h.chu in particular...it was just a convenient place to jump in...)

4974. Solution to Clearing memory [was Re: Another great quote from Mr. Good]

Newsgroup: comp.sys.atari.st
Date: 1988-08-13 16:39:12 UTC
From: dag@chinet.chi.il.us
Message-ID: <6311@chinet.chi.il.us>
Source record: 251274

I think this problem could be solved quite simply by using one of the reserved fields in the GEMDOS executable program header. One of these fields could be used for telling the OS that it does not have to clear the TPA before executing the program. This should not be a magic number, as there may be other features that programs will selectivly enable in the future, but at least two disjoint nybbles should be set aside to have a magic pattern that distinguishes the value from random garbage. This would be downward compatible as the older versions of TOS ignore this field anyway and the programs that set it would not be depending on the clear not being performed. Commercial programs could have this field set up if they don't need the memory to be cleared.

For extended functionality, programs that required that functionality could have a different initial magic number (hence a different header size) which would flag to the system that this program used this functionality. Older versions of TOS would not load these programs.

A third class of programs would use extended functionality only when it was available. A capabilities report could be added into the GEMDOS functions and these programs would have the old magic number but possibly set some of the flags in the same field that holds the "no-clear" flag.

As to the memory management scheme for eliminating the OSPOOL problems -- there are better schemes for doing it which don't break programs that make stupid assumptions about memory ownership and contiguity. Maybe another flag?

Yes, operating systems CAN be improved and extended without breaking a significant number of applications, even when the OS is GEMDOS!

Note: I left Mark Williams Company's employ in early May and moved to Madison, WI. I have not found a USEnet site that is willing to give me an account up here yet, so I'm off the news for a while. I occasionally call into Chicago to read my usenet mail, but this only happens about once a month for now. If anyone wants to reach me for questions or to yell at me for what I've just said, please call me at (608)273-8476 (nights) or write to me at 1022 D Sunnyvale Ln., Madison, WI 53713.

Note to A.Pratt (or anybody else) at Atari:
Call me if you still have questions about the MWC 3.0 symbol table. Also, since I'm a registered developer in my own right (not just through MWC) is it possible for me to get a beta set of the new ROMs?

4975. Re: Another great quote from Mr. Good

Newsgroup: comp.sys.atari.st
Date: 1988-08-14 01:27:57 UTC
From: Thomas_E_Zerucha@cup.portal.com
Message-ID: <8090@cup.portal.com>
Source record: 251275

If I understand right, there are actually two problems with Malloc violations.
1. Some people do a Malloc and use memory outside of the Malloc'ed range.
2. Some people expect successive Mallocs to return sequential addresses.
#2 is not true even now if your memory gets at all fragemented. If the
40 folder bug is fixed, the OSPool should be large enough to hold Malloc
Handles, especially if it returns memory into the OSpool correctly.
Alternately, (since I hope no one is expecting to use beyond what a Malloc
(-1) would return) you could put the headers at the very bottom of the largest
Mallocable segment and that might fix the problems and retain compatibility.
I hope you can now MFree in a different order than Mallocing and have it
work properly (this shouldn't be a problem to fix).
Considering I use RTX often, perhaps the 64 bytes extra may be enough of
a buffer to solve #1.
Perhaps you should try to do some of these fixes and see if your
compatibility percentage improves. And list what breaks. If you get to
98% or more, then perhaps it would be better to go to the fixed Malloc
(with the aforementioned compatibility patches). I seem to remember that
the Mega roms broke a few things.

4976. Re: Clearing memory [was Re: Another great quote from Mr. Good]

Source record: 251276

I think Dave Beckemeyer has an excelent idea about the TPA - and there are
a few "undefined" words in the header portion of the executable image.
All it would take is for Atari to say "This word is the number of 4K bloks
for the TPA", or "This longword is the size of the TPA". Have the current
value of zero for these unused locations default to a system setting like
RTX does, and I have some C code that could set the value of these which
I could have for anyone in 5 minutes. So could anyone else - just a simple
get value and write word into header.
BUT THIS REQUIRES ATARI TO SET THE STANDARD. Alternately a symbol could
be defined in that area of the executable, but I think there would be support
from the developers to have Atari define a new header byte.

In article <1045@scolex>, kurth@sco.COM (Kurt Hutchison) writes:
> I for one agree with the argument that releasing a new OS that breaks
> old software is a bad idea. Theological arguments about the proper
> behavior of programs always take a back seat to compatibility concerns.

And this is why operating systems have a limited life. Eventually the bugs left in to keep the old software from breaking accumulate to the point where it's not worth keeping the old software. This is one of the reasons UNIX has so far been so successful as a third party O/S: with no binary standard there's been no old software to keep running.

Now that Xenix and COFF have become binary standards, I expect this to change. In fact, it's beginning to... look how big the new SV/Xenix/BSD merge is going to be. Look how big SV already is.

> Remember the original PC clone wars? I worked for a hardware company then
> that made a PC clone which they thought was "better" than the PC. It didn't
> sell at all because it wasn't exactly compatible, you had to buy a special
> version of DOS for it and "Ill-behaved" programs didn't run.

But when *IBM* came out with a beter (and slightly non-standard) PC it sold just fine, despite the fact that ill-behaved programs didn't run on it. They've done it twice now, first with the AT and now with the PS/2 line.

> Ill-behaved
> programs are the rule rather than the exception, most programs that perform
> really well were Ill-Behaved.

This is because the operating system didn't support things, like fast text, that the programs needed. I thought one of the reasons for going with GEM was to keep stuff like this from happening.

There's nothing about your cheap Malloc that required programs to make assumptions about how memory was allocated. It could have been used like "sbrk" in UNIX as the low-level allocator... just split memory up into 7 or 8 chunks, and Malloc them whenever the existing malloc pool got filled up.

This reminds me of the bourne shell on UNIX... it assumed that you could always restart instructions after a segmentation violation, so it didn't bother allocating memory until it got a SIG_SEGV. It broke when UNIX was ported to the 68000, where this behaviour didn't work. A very close parallel: it was making assumptions about how memory management worked. But since this wasn't just a caese of binary compatibility, it was fixed (the alternative would have been to put two 68000s in every UNIX box, and use one to restart instructions...).

> While compatibility is not a universal truth, compatibility between OS
> releases is a good thing. Would you be willing to wait six months for
> new releases of all of your software so that it would run again?

People have done this time and time again. They just kept using the old
version of the operating system or computer while waiting for the new one
to get up to speed.

> Kurt Hutchison - The Santa Cruz Operation - Software Engineer

How did you people get the bourne shell working right on the '86?

4980. ATARINET

Newsgroup: comp.sys.atari.st
Date: 1988-08-14 21:04:10 UTC
From: uace0@uhnix2.uh.edu
Message-ID: <644@uhnix2.uh.edu>
Source record: 251280

ATARINET has just been updated with 43 new files. We have finally gotten around recent hardware and software changes, allowing us to get files to our system. If you are on BITNET and have interactive communications, then send a message like below to ATARINET.

From CMS use something like:

TELL UH-INFO AT UHUPVM1 ATARINET NEWS (for what is new) - or -
TELL UH-INFO AT UHUPVM1 ATARINET INDEX (for a list of all files - about 250)

From VAX/VMS use something like:

SEND UH-INFO@UHUPVM1 (at the prompt, type)
(UH-INFO@UHUPVM1): ATARINET NEWS
(UH-INFO@UHUPVM1): ATARINET INDEX

Enjoy.

We are still facing extinction of ATARINET when the university moves over to LISTSERV. If you would like to arrange taking over the duties of ATARINET, please contact me (in other words, move it to your university).

4981. MWC v3.0: Bug and solution

Newsgroup: comp.sys.atari.st
Date: 1988-08-14 22:44:50 UTC
From: rob@baloo.eng.ohio-state.edu
Message-ID: <470@accelerator.eng.ohio-state.edu>
Source record: 251281

```
The following program breaks the MWC C compiler (v3.0, I don't know
about others):
------- try.c -----
float foo( bar )
float (*bar)();
{
return (*bar)(3.0); /* breaks here */
}

float sqr( sink )
float sink;
{
return sink*sink;
}

main()
{
printf( "%g\n", foo( sqr ));
exit(0);
}
------- end of try.c ---

Compile this with
cc -f try.c

to get an ``internal compiler error'' referring to the line commented
with ``breaks here''. I called MWC tech support, and they told that
they knew of the problem and were working on it, but for the time
being there was a very simple solution: change the declaration for bar
to
double (*bar)();
and it will work.

Making the appropriate changes indeed causes the program to compile
and link without errors; when run, it gives the correct output
(9.00000), and terminates normally.

BTW: tech support from MWC was very good: I was talking to the right
guy in under 30 seconds, and he was polite, helpful, to the point, and
knew what he was doing. They left a good impression there.

I have an idea, why not provide both 'fixed' Malloc and the
old Malloc to developers. You can use #define old_Malloc switch
in header file for programmers to choose which one, provided
the new TOS ROM has enough space to put both versions of Malloc
in.

4985. To Fix or Not To Fix

Newsgroup: comp.sys.atari.st
Date: 1988-08-15 05:11:49 UTC
From: bryan@ihnet.ATT.COM
Message-ID: <635@ihnet.ATT.COM>
Source record: 251285

There is a very simple solution to the problem of fixing things in
the ROMS that cause bad programs to break.

If you have a program that does not work with the old version of the OS
then boot from Floppy the old version of the OS and use your program!!

Remember the Original 520ST came with a floppy that booted in the OS

I'm not sure that htis question really belongs in this group but
I couldn't think where else to put it.

Has anyone else out there been playing Captain Blood ??

If so, how are you doing. I think the game is superb - both graphically and in
concept however I also think it's too DAMN HARD !

For instance what should you do with the Croolis ulv/vars ??

Kill either group to get info or does it matter which one ?

I've clocked up about 5 hours spread over several games and still have
the real feeling of gettting nowhere !

Comments from anyone else (maybe I'm missing something ?)

4988. How to post umoria?

Newsgroup: comp.sys.atari.st
Date: 1988-08-15 14:33:47 UTC
From: saj@chinet.chi.il.us
Message-ID: <6321@chinet.chi.il.us>
Source record: 251288

I have umoria from the comp.sources.games distribution working well enough that I'm finally confident that it can be fixed up completely for the ST (maybe not 520K memory, though). I doubt that I'm the only one in this position (or farther along). So in a week or so, unless someone stops me, I'll be sending binaries to Steve Grimm. The question is what to do about sources: the original posting was 18 parts, which seems excessive. I'm inclined to post ordinary diffs and the few new functions I had to add. If anyone has a pointer to a publicly distributable context diff generator for the ST, this might be a good time to mention it. At best, umoria is fragile enough and complex enough that one wants sources somehow. By the way, my adaptation is compiled with Mark Williams C V 3.0.6. Anyhow, what do we do about long sources slightly modified from other newsgroups?

4989. for sale: magic sac/translator one system

Newsgroup: comp.sys.atari.st
Date: 1988-08-15 14:59:47 UTC
From: toml@xrxns.UUCP
Message-ID: <287@xrxns.UUCP>
Source record: 251289
Cross-posted to: comp.sys.atari.st,misc.forsale

For Sale:
Data Pacific Magic Sac Plus (macintosh emulator & clock cartridge and software)
Apple Macintosh 64Kbit Rom chips (already installed).
Data Pacific Translater One (permits magic sac to read/write
mac-formatted floppies).
Numerous (approx 20) disks of magic-format public domain mac software.

Also included are all the manuals, newsletters, and the mac-to-atari cable for downloading. The software is current rev, though offhand I don't recall what that number is. The cartridge and roms are about 1 yr old; the Translator is about 7 months old. All hardware and software is in perfectly excellent working order.

For those not familiar with it, the Magic Sac system does an excellent job of emulating a Mac 512 (or larger, depending on how much memory you have) on an Atari 1040 ST or Mega ST system. Without the Translator One device the Magic Sac is limited to using its own unique floppy format, making interchange with a real Mac inconvenient - but with the Translator, the Atari/Sac combination can read, write, and format Mac-format floppies. The Sac software also supports a hard disk, if you have one. While the Atari color monitor is supported, the monochrome monitor is recommended (it actually provides a larger screen area than that on a Mac). An added bonus is the battery-backed clock included in the Sac cartridge, useful in either TOS or Magic mode of ST usage.

The reason I am selling my Magic Sac system is because I was made an offer I couldn't refuse on a Mac Plus system, and have little use for two Macs.

My total investment in this package is approximately $475. I will sell the whole shooting match, including shipping, for $300. I'm pretty firm on this, but I might consider an offer if moves slowly - try me!

I might also consider selling my Atari monochrome monitor, as I also have a color monitor. Make me an offer.

Reaching me via uucp is sometimes challenging - I suggest a telephone call or, failing that, a note in the postal mail. See relevant addresses etc below.

4991. Ctrl-C

Newsgroup: comp.sys.atari.st
Date: 1988-08-15 17:19:49 UTC
From: steven@cwi.nl
Message-ID: <7620@boring.cwi.nl>
Source record: 251291

Gemdos only registers a ctrl-c when something is written to the
screen, or read from the keyboard (and then only non-raw I/O).

I've struggled to find a way of getting Gemdos to react at other
times, but all with failure. I've tried testing to see if a character
is available, writing zero characters with Cconws, and a dozen other
ways, all to no avail.

With MS-DOS (on which Gemdos is modelled), there is a way of polling
to see if a ctrl-c has been typed, by telling Dos that you also want
ctrl-c checked when non I/O system calls are called, and then doing
some benign system call, like reading the time.

Unfortunately, with Gemdos they apparently forgot to allow this.

So it seems to me that the only way of allowing ctrl-c when you're not
doing I/O is the following:

If output is not redirected: periodically write a NUL;
this seems to have no effect on the screen, but does
generate a ctrl-c trap if one has been typed. (If the
output is redirected, the NUL's end up in the file.)

If output is redirected, but input is not redirected:
periodically read and buffer the input yourself.
You could also do this in the above case.

If both are redirected: read and discard raw characters from
the keyboard, checking for ctrl-c.

My question is: does anybody know of a simpler method?

>we're talking about isn't it? :-)
Actually, I thought that Mr. Reschke probably was referring to providing GEM on top of X11 which, I believe, would be a very nice thing to do for existing Atari developers who would have a reasonable shot at porting their software to the new machine. Mr. Reschke's suggestion about a 'Multi-Desk' is probably a good one also (would be nice for the ST series now) but is probably unnecessary since the various X window managers already provide this functionality. Even so, a real desk top window manager designed for use with GEM and other pure X window programs would be a very nice touch.

Actually, it sounds like Atari is on the right track with the software they are planning for the 68030 box. I am more concerned with the hardware. Will they include memory parity? a large, high-resolution monitor?

And, finally, of course, I am concerned with whether it will be available in the U. S. in a decent timeframe. The rumored personal VAX is supposed to be announced next month. Those of us who have purchase decisions to make will soon have some attractive choices in the $4k-$7k price range. Will Atari be there?

4994. Alas, poor Malloc... (Re: Another great quote from Mr. Good

Newsgroup: comp.sys.atari.st
Date: 1988-08-15 19:52:16 UTC
From: stowe@silver.bacs.indiana.edu
Message-ID: <2142@silver.bacs.indiana.edu>
Source record: 251294

Quite honestly, I believe that a bulletproof Malloc would be superior even if it meant waiting for new versions. As has been stated, run the old version if it's that important, but I'm a firm believer in the adages "If something is worth doing, it's worth doing well" and "Good things come to he [she] who waits."...

It seems that people (developers included) have been kvetching about Malloc enough for Atari to realize they consider it to be a real problem and also would like to have it corrected. It also seems that if they wish to develop and sell products, they will make whatever corrections they deem necessary to do the job... after all, isn't that what they had to do in the first place?

I agree! I must confess ignorance with regards to the ":-)" convention
as I hadn't seen it before. Now that I can see that I was probably the only
person on the net who didn't see the humourous intent and I'm sorry if I came
on too strong. Again, I appologize to Mr. Bannister and all others who may
have been offened by my reply.

P.S. Please excuse the mangeled posting earlier!

4996. Atari vs. Amiga: what to buy?

Newsgroup: comp.sys.atari.st
Date: 1988-08-15 22:22:03 UTC
From: dld@f.gp.cs.cmu.edu
Message-ID: <2711@pt.cs.cmu.edu>
Source record: 251296
Cross-posted to: comp.sys.atari.st,comp.sys.amiga

I'm looking to buy a cheap but technically advanced computer. I'm a computer science grad student, and I would (eventually) like a home environment as much like my work environment as possible. I would also like to use my home machine as a MIDI sequencer. It seems like either an Atari Mega ST or an Amiga 500 or 2000 are the likely candidates. I was wondering if any of the readers of these newsgroup would care to offer any (non-religious) comments on the relative merits of these machines. I will attempt to put forth some pros and cons as I perceive them, and hope that people will add to or comment on these comments. I'd also be interested in some recent price quotes to see if my local dealers are out of line.

I'm going to compare the Mega 2 to an Amiga 2000.

Perceived Atari Pluses...

1) Cheaper. (Quoted locally $1700 vs $2200 for Amiga).
2) More Memory -- 2 Meg Standard vs. 1.
3) Built in MIDI Ports -- saves a small expense.

Perceived Amiga Pluses...

1) Better graphics? Do I correctly recall that the Amiga has more colors available and has more bit-planes? Or is this not the case? Is there a difference in the performance of the blitters?
2) Multi-tasking operating system.
3) Better upgrade paths... I've read, on these news groups and elsewhere, about 1000x800 monitors for the Amiga, 68020 + Coprocessor boards, Unix, X, etc available, or nearly so, for the Amiga, but nothing nearly this exciting for the Atari. Any Atari fans wish to rebut this asssertion? Any Amiga fans to add to this list?
4) I have a vague sense that there is more software written for the Amiga.

I realize that a post of this nature runs the risk of inciting a flame war. However, I am quite honestly confused. I hope people will be polite and considered in their responses. If there is interest, I will summarize.

Thanks...

Dave Detlefs, Carnegie-Mellon CS.

4997. Re: Midi Mega's

Atari is yelling because someone didn't have THEIR faxts straight?
Anybody remember the announcement by Atari about a video game you
could control with your mind? I'm not kidding about this, I
think Isaw a blurb about it on CNN a couple of years ago.

One of the reasons I don't own an ST is because of Atari's consistantly
strange behavior in making satements to the press.

/ wdl1:comp.sys.atari.st / braner@batcomputer.tn.cornell.edu (braner) / 1:12 pm Aug 12, 1988 /
[]
M. Banner writes about Malloc:

Use malloc() (lowercase m), the library function that came with your C
compiler. Assuming you got a decent compiler (Laser, Megamax, MWC, etc)
(I don't know about Alcyon) that will keep you out of trouble.
Make sure you use free() for what was malloc()ed, not Free().
The only case where you need Malloc() (uppercase M, the GEMDOG function)
is when you absolutely need to allocate more than 64K at once, since
malloc() takes an unsigned int as its argument, and an int on the 68000
is (or should be) 16 bits.
...
In fact the MWC compiler has an lmalloc(lsize) which takes a long as an
argument, so in that compiler at least, there is no need to use Malloc.

4999. RE: (i)Idiotic postings (ii)looking for information

Newsgroup: comp.sys.atari.st
Date: 1988-08-16 02:14:06 UTC
From: 01659@AECLCR.BITNET
Message-ID: <8808160511.AA02483@ucbvax.Berkeley.EDU>
Source record: 251300

Date: Mon, 15 Aug 1988 22:06 EDT
From: <<<<< Greg >>>>> <01659@AECLCR>
Subject: RE: (i)Idiotic postings (ii)looking for information
To: <INFO-ATARI16@SCORE.STANFORD.EDU>

For about 4 or 5 weeks now I have been reading the info-Atari16 postings and have come to the conclusion that (i) every once in a while something useful appears and thus I should continue reading the postings and (ii) if most of the dialog in the postings is typical of multi-user banter on a BBS then I would be embarrassed to admit I was a participant. For example, I have had to endure the inane dialog about parochial Americans, lousy Rolls Royces and hype about Mercedes and Porches. Can someone invent an electronic filter to clean out the refuse from the postings?

Can the persons who post listings please use a little discretion and refrain from bickering back and forth? How about some straight ahead technical info about ST hardware and software. PLEASE!!!!!!!

I have a Mega2/Megafile20/SM125 system at home and a 1040/SH204/SM125 system at work. I use WordWriter, WordPerfect (under PC Ditto) and MS Word (under Magic Sac). I use dbMAN on my ST and dBASE III Plus on my AT at work. I use VIP, LOTUS (on my AT) and EXCEL (under Magic Sac). I use UNITERM or ST640 to log on to a CYBER system and will soon get an account on the new VAX system installed at work. Postings about any aspect of what I have listed would be greatly appreciated.

ST640, very much a UNITERM look-alike, was put out by the TRIUMF facility in Vancouver, British Columbia, CANADA. However, ST640 has a nice feature UNITERM lacks (at least I am unaware of UNITERM providing the feature). TEK4010 plots generated by CYBER applications (or any mainframe pkg that produces TEK4010 device dependant files) can be written to EASYDRAW (and GEMDRAW) files. I can use a sophisticated CYBER plotting package, capture the figure to file, edit the figure using either EASYDRAW or GEMDRAW (on my AT) and dump the final figure on an HP laserjet II. This avoids having to use the site's central plotter and figures can be electronically pasted in to 1ST Word Plus documents (on the PC). ST640 will let you use inexpensive 520STs as terminals that can capture plotter output for importing to documents. When you consider that a 520ST is not much more expensive than a PC application like Smarterm 240 and that ST640 is public domain it is easy to see why some groups are standardizing on STs as terminals.

One of the groups at work uses 1040STs with MAGIC SACs. No ST software is used. The group uses EXCEL, MS WORD etc. Group members and I would dearly love to have AppleTalk capability for the STs so we could talk to Macs. Is any AppleTalk capability in the offing from anyone out there?

Lastly, most STs at work are hooked up to SL/1 phones to get to the CYBER and the new VAX. If the VT52 desk accessory is installed any ST can instantly receive a message from any other ST simply by dialing it via the SL/1. Is there are SMART terminal program that is (i) a desk accessory and (ii) will automatically accept info on an interrupt basis even though the desk accessory is not currently active. If so, then all our STs will have a direct, on-line E-mail service with fully file exchange capbility. Any assistance in this would be very helpful.

5001. Suggestion for compatible fix to Malloc()

Newsgroup: comp.sys.atari.st
Date: 1988-08-16 03:22:44 UTC
From: preston@felix.UUCP
Message-ID: <53857@felix.UUCP>
Source record: 251202

There is more than one way to go about this.

If some (arguably stupid) existing programs expect successive Malloc's to return contiguous blocks, then you _could_ allow those programs to continue working by:

- Allocate your (GEMDOS's) bookkeeping data structures (call it overhead) seperately from the areas allocated to the program.

And either (or both):

- Allocate overhead in chunks (i.e. 10 or 20 at a time) with the first chunk allocated _before_ the program begins execution (either in the OS space or just before the basepage.

- Allocate overhead starting from the _high_ (opposite) end of available memory.

If you allocate your overhead in chunks, then if the existing programs do a small number of Malloc's, then all the overhead will fit in the first chunk.

I suspect that would cover most (all?) of the misbehaving programs.

Any comments? :-)

5002. ASSEMBLY MOVE/CLEAR/SET/COMPARE ROUTINES (was Clearing memory chain)

Newsgroup: comp.sys.atari.st
Date: 1988-08-16 03:43:42 UTC
From: dillon@CORY.BERKELEY.EDU
Message-ID: <8808160343.AA10248@cory.Berkeley.EDU>
Source record: 251203

```
>I think this problem could be solved quite simply by using one of the reserved
>fields in the GEMDOS executable program header. One of these fields could be
>used for telling the OS that it does not have to clear the TPA beforeexecuting

Half of this conversation is silly. Since when is clearing memory
slow? A properly written memory-set/clear function will use, say, 12 or 13
registers filled with the pattern and then loop on movem.l instruction.

Needless to say, this is *fast*. Very fast, in fact.

And before some of the less sophisticated start blabbering about
special cases, following is some *GENERAL* 68K code for clearing, moving,
and comparing memory.

All routines work on arbitrary boundries, and optimize according to
the block size and alignment, all the way to using multiple-register moves
to accomplish the goal. bmov() will do either an ascending or decending
copy accordingly, allowing for overlapped moves.

SPECIAL NOTES:
-All calls take 32 bit quantities for any pointers or integers. Note
-especially that the BSET() function takes a long for the fill
character even though only a char is used. Simply modify the code
to fill your needs.

-This assembles under the Aztec assembler. Some modifications may
be required to work on other assemblers. However, the code is
COMPLETELY self contained.

-Code is set up for being called from C, with arguments pushed on
the stack in reverse argument (i.e. first arg is 4(sp), second is
8(sp), and third is 12(sp) on entry to the call)

-D0/D1/A0/A1 are all assumed to be scratch and are not saved.

-Matt

Good question! And is there anyone out there working on porting gcc to
the ST? Please, I think this could be an interesting bit of PUBLIC news,
interesting to quite a large part of the net...

One thing that one *must remember here though.

Although one can boo ththe old rom from floppy, that does not
mean the program will work. I have the Blit roms installed in my
machine, and although say a program bombs with say 4 bombs, when
I boot the TOS on disk, and then run the program, I get 2 bombs,
er mushrooms...

One comes immediatley to mind, say ST Accounts.

Also remember that many are self booting disks, and don't always
blow GEM\TOS out of the machine.

Some random thoughts on Superquest's use of ATARI ST's:

So,
Did everyone see all those Atari ST's (Mega-2's) on CNN on 8/15? They were showing the Superquest students in their final competition for a supercomputer for their high schools (an ETA-10 Supercomputer). And, of course, we had 16 Mega-2 ST's handy for their use. Thanks to Atari, the kids and the teachers all ended up with their own Mega-2 ST's and the 5 schools each got their own Desktop Publishing System. Both Sig Hartmann and Sam Tramiel showed up at the awards banquet and I was happy to hear the president of ETA mention the Atari ST and acknowledge Sig and Sam during the presentations. The Atari's worked out VERY well for local Fortran compiling, acting as smart terminals (via UNITERM and Unix Windows), some spreadsheet work (VIP, ACALC), some documentation (EASYDRAW, Timeworks Publisher, First Word Plus, Fontz), and even some good heavy duty game playing the last day after the presentations were made (MIDIMAZE was the main attraction).

I would estimate that these kids put in a good number of 80 hour workweeks during the 7 weeks that they pounded on their ST's, the Silicon Graphics workstations they were connected to, and the ETA-10 that they networked into via the SG. Aside from some frustrating problems with the Unix Windows software (losing the cursor quite often), I am happy to say that all the ST software worked out quite well. Some of the students still prefered the user interface of the Mac for desktop publishing, while others preferred the PC-portables, so a number of 'other' PC's were also made available to them. Two things that we saw that the ST desperately needs are 1) a much better user-interface to the desktop publishing and word processing programs (specially in relation to getting WYSIWYG vis-a-vis fonts and quick-draw type programs), and 2) more advanced math/statistical related graphing programs.

Let me say first, an excellent article! But to pick a nit (at your request),
the control elements of thermionic emission devices (aka Fleming valves,
or in some benighted venues "tubes" ;-) are called `grids'. The first grid
is usually called the control grid; some common devices have up to five grids.

In apology, let me say that I learned my basic electronic principles using
this technology for my active devices (bar some 1N34's) :-).

From: landay@cory.Berkeley.EDU
Message-ID: <5037@pasteur.Berkeley.EDU>
Source record: 251208

This evening I was trying to speed up my hard drive by unfragmenting it. I used Simon Poole's REGORG (v. .04) First I did partition C. No Problem (I had FOLDER999.PRG in case of 40 folder problems) I then rebooted. Did partition D. After 10 mins. or so, strange things started to happen. The amount done indicator reached the end of the space for it and kept going. Went past the end of the dialog box. Kept going. To the edge of the screen. CRASSSSSSSSSSSH!!!!!!!!! BOMBSSSSSSSS!!!

Rebooted! Partition D was fried!!! Luckily I had backed up with Turtle the night before (great program George!) I used the BMS utility to zero out the partition and proceeded to restore partition D (how are you supposed to restore from Turtle backed up disks? I had to use some program run from Gulam that someone posted a while back called RESTORE.)

I don't know where I screwed up, but I ended up with an directory with a blank name that when entered showed everything in the root. (and the same if I entered the blank one in that directory) Seemed like a circular pointer problem. I used a disk editor and some docs someone posted on the floppy FATS a long time ago and wiped out that entry. It seems to work. Is that the proper way to go? (I couldn't get any programs to fix it, DLII or Disk Doctor.)

Is there a new (safe) version of REORG?

Thanks,

D

From: rwa@auvax.UUCP
Message-ID: <692@auvax.UUCP>
Source record: 251210

[fancy line-eater line down for preventative maintenance; call later]

In recent articles, Roy J. Good @ Atari and others discuss the Malloc problem (qv). May I suggest the following solution:

1) build a proper version of Malloc (MallocP for "malloc patched" comes to mind). Assign it a TOS-call number, and give it reasonable semantics; Un*x semantics are as reasonable as any [:-) :-)].

2) use this reasonable allocator as a foundation for a version broken in exactly the same ways as the current TOS version. That is, it obeys the assumptions that people are making about the current allocator (that it's okay to exceed your chunk, that chunks are contiguous, et al.), and make this broken allocator available through the old TOS-call number.

3) encourage people to use the new allocator; they will because it's no longer broken, right ?

4) after a while, make the old entry point go away (if you want).

Now, this may be a little tricky. You might have to compromise some functionality in the back-compatibility entry-point version. For instance, it might be only able to allocate 1/3 or 1/2 of the total available free memory (here's a reason to use the upgraded entry point :-).

I don't know if this is THE answer, but it might be AN answer. Comments ?

>that CSD will not single-step within code which is executed while in
>Super() mode. Am I doing something wrong, or is there a definite and
>undocumented restriction to MW_C's CSD?

Some remarks:
When a debugger single-steps through your code, a commonly used technique is to push your program's current status word and program counter onto the supervisor stack, setting the trace bit in that status word and performing a RTE. When the instruction at your program's program counter gets executed, a trace exception occurs - and the debugger takes over control again because the trace vector has been set up to point into the debugger.
The 68000 clears the trace bit in the status word whenever an exception occurs (otherwise your debugger would get single-stepped, but only the first instruction, recursively... 8-). This implies that you cannot single-step exceptions (this includes traps, and thus GEMDOS, BIOS, XBIOS and GEM traps), unless the debugger 'takes over' at an exception (needs a table for all old exception vectors, and all current exception vectors point into the debugger). This you probably have not noticed, because you step at source level (could well be done without trace bit, using breakpoints; this however is restricted to code in RAM).
An (perhaps acceptable and maybe undocumented) restriction of CSD could thus be that it does not let you single-step a trap (whether this is in fact true I don't know); I've however seen this with other (code) debuggers for the ST.

I checked the Super() call (got curious of course 8-), but as far as I can see, it correctly preserves the trace bit in the status word. That is, when the TRAP #1 exception finishes the bit is what it was before the exception occured; the code within the trap cannot be traced (unless ..., see above).

Some hints:
a) try what you did using the XBIOS Supexec call, which performs a function in supervisor mode. If this also does not work, I would suspect CSD having trouble with supervisor mode for some odd reason.
b) Have you used Super() correctly? Example:

```
long ssp;
```

```
ssp = Super(0L); /* save supervisor stack pointer & switch to s. mode */

/* supervisory stuff here , with ssp == usp */

Super(ssp); /* back to user mode, restore old supervisor stack ptr. */
```

An error you could have made easily is calling Super without argument...

Hope this helps -

Leo.

P.S. A simple program to display the bomb info I posted to this group some months ago (does not show stacks); you can have it, unless of course you want to 'C for yourself' 8-).

5012. Re: Atari vs. Amiga: what to buy? (Atari side)

>might also be necessary to have two versions of Free.

This is a lot better idea than keeping broken procs in the new roms. Adding
a new Malloc called Malloc2 (etc.) would say a lot to developers &
ST programmers in general about the quality in the ST. It's the best
of both worlds and would rather wait awhile longer to see this done, than
buy (or most likely NOT buy) ROMs that are only partially fixed. How
do we know we won't be stuck with similar bugs in future machine???
I for one wouldn't buy a 68030 or any nxt generation Atari if these
bugs were allowed to stand for ever.

Bernie

5014. Hard Drive Headaches

Newsgroup: comp.sys.atari.st
Date: 1988-08-16 14:27:41 UTC
From: elixir@m-net
Message-ID: <2171@m2-net.UUCP>
Source record: 251214

I have the following hardware setup as my bbs.
An old atari 520ST(ONe of the first with TOS in ROM)
I am using a 1meg expansion board (ONe that uses the
shhifter I think? Instead of the two small chips!?!?)
a single sided drive (I swap a double sided drive off my other
system for backups)
An ICD Host adapter, the Adaptek RLL controler (4070a?)
and a segate 277rl drive...
My sw is Forem 2.3 and here's my problem...
After a while my bbs starts to crash.. It can't find files..
But I dont think it is the bbs sw since a friend of mine
had a simular happening with his bbs also..

THe file IS accessable via desktop BUT NOT from the GEMDOG
File opening box, the interlinks file selector, or anything else..

Whats the beef? Is this a problem in Gem or in ICD's stuff?
A temporary fix seems to be to reformat the drive and move all the stuff back..
But when my 65 meg drive gets full that will be a very painful thing to do.

I AM currently running Turbo Dos (A disc cache from Atari France)
but the problem showed its head before to me before I even knew what turbo dos
was.. (THis is the second time this problem has happened to me in 2 months)

WHat causes this and is there an easier way of fixing it?
I also must say that I have shut the computer off a few times due to locked up
programs and when I was using arc...
(Ever type "m destination source" but when typing the source you hit
the return key instead of the \ while selecting the directory?
On a hard drive with a 16 meg partition of which 4 meg is used
I dont fancy the idea of letting 4 meg go arced, then erase the four meg,
and then have to recover by doing the reverse..
Not my idea of a fun half hour)

Which brings me to ask another question.....
Is there an EASY way of arcing a directory into seperate files instead
of doing numerous "M destination source" calls?
I really don't feel to enthused about trying to write a shell to do it but
will if I have to..

5015. Printer driver for Toshiba P1340 ?

Newsgroup: comp.sys.atari.st
Date: 1988-08-16 16:12:30 UTC
From: schell@iris
Message-ID: <2757@ucdavis.ucdavis.edu>
Source record: 251215

I am the unfortunate owner of a Toshiba P1340 24-pin printer. As far as I know, it is incompatible with every other printer in the universe and most software. The problems are three-fold: (1) NLQ/draft, bold, underline, etc. commands are not the same as any other printers (except, possibly, for the Toshiba 3-in-1 series); (2) Graphics format is WIERD, requiring 4 bytes of 6 (yes, six!) pixels for each column of output (unlike the other Toshiba printers, I believe); (3) I don't want to reinvent the wheel if someone else already has.

I can configure a 1st Word setup file for it (to give a limited subset of 1st Word's abilities), but can't convince Degas, EasyDraw, etc. to print on it. I wrote a screen dump routine (worked) and built it into Tom Hudson's printer driver programs (didn't work, probably due to my own incompetence).

Are there existing (PD or commercial) printer drivers for this thing? If not, is anyone interested in a good-quality 24-pin printer CHEAP ? All offers considered.

Thanks very much.

Stephan Schell

->
-> Bryan DeLaney
-> AT&T Bell Laboratories
-> Naperville, IL
```

now why didn't our friends at atari think of that? all they would have to do is provide a floppy boot disk with the new ROMs containing (say) the 11/20/85 OS or the mega os. they could even make another incremental profit by charging (say) $10-15 for the floppy (if the person ordering wanted it). it shouldn't take more than a man month to put the os on a bootable floppy and maybe another man month to test. i suspect they really didn't fix anything or they just don't have the marketing saavy :^).

good suggestion...hope atari is listening...

5018. Re: ASSEMBLY MOVE/CLEAR/SET/COMPARE ROUTINES (was Clearing memory chain)

Newsgroup: comp.sys.atari.st
Date: 1988-08-16 19:13:25 UTC
From: apratt@atari.UUCP
Message-ID: <1119@atari.UUCP>
Source record: 251218

dillon@cory.berkeley.edu says something about clearing memory being fast
when using movem and lots of registers. He is right, but on a 4-meg
machine it still takes appreciable time. It takes almost a second,
which is a long time if you do it a lot for short utilities loaded off
hard disk:

At 4 clocks per longword to do the memory access, it takes
4*3.5MB = 13,107,200 clocks, or ~0.82 seconds at 16MHz to
clear 3.5MB, not counting instruction fetching and looping
overhead. This also doesn't count the fact that video
memory cycles are interleaved with processor memory cycles;
I don't know what that impact will be.

The clearing code in the 11/20 ROMs (pre-Mega ROMs) is stupid and
slow, which is why it takes appreciable time to clear 1 Meg. The
Mega ROMs fixed this, but clearing 3.5 Meg still takes a long time,
and future machines may possibly have up to 10 Meg -- clearing
9.5 Meg will not be pleasant:

It would take 38,273,024 clocks (~2.4 sec) to clear
9.5MB at 16MHz, but fortunately any machine with that
much memory will probably run faster than 16MHz.

These numbers are back-of-the-napkin computations, and I may have
some major flaw in my arithmetic, but .82 seconds sounds right to me.

You can speed up memory clearing on a Mega 4 by installing a 2MB RAMdisk...

Cross-posted to: comp.sys.atari.st,comp.sys.amiga

ATARI VS. AMIGA: WHAT TO BUY?

* the bottom line is -- whatever you like best. *
but here are some thoughts:

WORK/SCHOOL OS features:
========================

What kind of environment are you using at work/school? It is
Likely Multi-tasking. (VAX VMS, UNIX, ?)

- (AMIGA & ST) If VMS, I don't know of any VMS look-alikes for
either machine. there is a PD editor (TVX) that can be configured
to look like the VMS EDT editor I think... I know it can be made
to look like VI and emacs/jove/uemacs... (unix).

- (AMIGA) If unix at work,... unix editor PD look-a-likes "vi" and
"emacs" are available. (They are also available on the ST).

- (ST) If unix at work, then note that an ST version of MINIX
has gone to Prentice Hall for distribution (out in Sept? - check
comp.os.minix on when). You are familiar with MINIX? It is Version
7 unix look alike muli-tasking OS, comes with compiler and
unix-behaving tools.

- (AMIGA) As you know the Amiga has multi-tasking built in, so it you
can handle a different interface from the one at work, but are
used to multi-tasking, you are already set.

- (ST) UNIX? Today *now* there is a nice PD shell on the ST (gulam)
that looks a lot like the unix shell with many of the
commands. The editor is emacs-like, and you can pause the
editor, escape to the shell, compile a program, then bring
the editor back to the fore ground (via "fg" a-la unix). Not
multi-tasking. Context switching, but it is the unix look and feel.

- Note: Amiga and ST can run MSDOS stuff with appropriate add-on's.
ST cam also run MAC stuff with appropriate add-on's.

MIDI:
=====

The ST came with midi's built in and this has generated a lot of
ST midi software. Buy a copy of STart magazine. There are always adds
in that artist-oriented magazine for music editors, and multiple other midi
programs. I do not know what midi stuff is available on the AMIGA. I
think there is a large library of midi software on the PC market. You

may wish to look here too...

Final suggestions:
1. Get several machine specific magazines on both computers.
Try to stay away from those published by the machine manufacture; they tend to be censored and over-hyped: "See how great we are!!!!!!!!".

2. Please try before you buy. - you may hate the feel of the keyboard.

BOTH good computers, you probably can't go wrong what ever you choose. To be fair, I do not own an Amiga. I own 2 Commodors (the VIC-20 & C64) am the happy owner of 1 Atari (the ST).

I will not suggest either computer over the other. That is a personal preference. A choice only you can make. My experience with both companys is about the same. They are probably on a par with the rest of the retail computer industry.

->There is a very simple solution to the problem of fixing things in
->the ROMS that cause bad programs to break.
->
->If you have a program that does not work with the old version of the OS
->then boot from Floppy the old version of the OS and use your program!!
->
-> Bryan DeLaney
-> AT&T Bell Laboratories
-> Naperville, IL
```

now why didn't our friends at atari think of that? all they would have to do is provide a boot disk along with the new ROMs containing (say) the 11/20 OS or the mega os. they could even make another incremental profit by charging (say) $10-15 for the floppy (if the person ordering wanted it). it shouldn't take more than a man month to put the os on a bootable floppy and maybe another man month to test. i suspect they really didn't fix anything or they just don't have the marketing saavy :^).

good suggestion...hope atari is listening...

->
->Steven Pemberton, CWI, Amsterdam; steven@cwi.nl

you could modify the entry into any of the gemdos/bios/xbios traps (see osbind.o) to check for ^C. in this way, when any system call was made, a check is first performed. this is not really equivalent to signal(3) under unix, but is better than what's there now. MWC has a signal(3) function but i don't know how/if it works. alcyon's does not seem to work.

5023. TCP/IP for the ST

Newsgroup: comp.sys.atari.st

From: glenne@hpnmdla.HP.COM
Message-ID: <810003@hpnmdla.HP.COM>
Source record: 251223

Hi All,
To the many who wrote me about TCP/IP code for the ST please accept
my apologies for taking so long to respond to your requests for
code but I haven't known how to best get it distributed and E-mail
to many of you got bounced.
Presently part to all of the sources,binaries and documentation
may reside at UCSD.EDU under /pub/hamradio. It may also be at
louie.udel.edu under pub/ka9q now or very soon.
In addition to the above, Rich at lakesys has offered to make it
available from there and as soon as I can figure out how to get it
to him I hope that will happen. I have a problem that I have no access
to anon FTP. Rich, send me some E-mail so my mailer can do a return path
that doesn't bounce.
Source files number over 100 and documentation includes
amateur radio specific portions as well as a nice tutorial on TCP,
SMTP,FTP,TELNET,ARP,UDP etc in general. Sorry if I am slow, I'm
doing my best as a total novice to both Usenet and UNIX!
I am running the package at home on the the local amateur radio
TCP/IP network and it *does* all *seem* to work.
The code I have is from earlier this year (an earlier rev) and
was compiled under LATTICE. I hear rumblings that the ST may be
supported in future releases,there have been several since this port
of the code. PC,MAC,AMIGA,UNIX and perhaps others are presently supported.

oh yes....
The files are archived at UCSD.EDU under NETST.ARC. In addition there
may be another (similar?) archive under NET_ST.ARC.

5025. Re: ASSEMBLY MOVE/CLEAR/SET/COMPARE ROUTINES (was Clearing memory chain)

Newsgroup: comp.sys.atari.st
Date: 1988-08-16 23:09:22 UTC
From: egisin@watmath.waterloo.edu
Message-ID: <20383@watmath.waterloo.edu>
Source record: 251225

Why do so many people think movem is faster than the
more straight-forward loop of move.l's?

copying 12 long words with movem (a0)+,regs; movem regs,(a1); add.l Rn,a1"
takes 242 cycles on the 68000,
while 12 successive "move.l (a0)+, (a1)+" takes 240 cycles.
(timings derived from Motorola'a 68000 manual)
when copying fewer words, move.l is even better.

the move.l appoach does not require saving and restoring all
your registers, and can be coded in C with decent compilers.

While a boon in the developement stage it is a hindrace at the marketing
level.

It is not true of SCO Xenix, we support every binary ever made for any SCO
XENIX. Our 386 OS will run 8086, 286 and 386 binaries unchanged.
This has turned out to be a good thing for us. Our binary formats
encode which CPU and OS version they were compiled for. The same
strategy works for whether it is a Xenix III or V Binary or a Unix Sys V binary,
or COFF format (all of which we support).

In spite of this, Xenix has evolved and changed. There are lots of
new calls and some old ones (still supported) that are officially obsolete.

>
> Now that Xenix and COFF have become binary standards, I expect this to change.

Lets hope that memory keeps getting cheaper :-). Our users have confirmed
many times that they want backwards compatibility, memory is never
an issue. Keep in mind that we sell primarily to businesses who
have a little more money than the Atari end user. Atari wants
the business users though so these examples are potentially valid.

This is a good point worth discussing. When the non-standard
PC's came out they instantly became a standard. Dos was modified so
that it knew which hardware it was running on and the apps followed
suit. "Three times" means about once every three years. Atari's
OS releases are far enough apart that I will concede that it would
be reasonable for them to consider fundamental changes to their OS.
If they released updates every six months they would not want to do this.

As long as the hardware/OS combination *allows* bad behavior, there will
